

OWNER'S MANUAL

I TALK IITM

ITALKII

WARRANTY INFORMATION

RealTime Electronics warrants the accompanying instrument to be free of defects in materials and workmanship for a period of one year from the date of retail purchase. This warranty is extended to the consumer of the instrument.

RealTime will repair or replace the instrument at no charge, if examination at the factory discloses no evidence of abuse, accident, or misuse. All transportation charges are at the expense of the owner. Enclose \$2.00 in check or money order with your instrument to cover return shipping charges.

Return of the instrument to the owner, or notification to the owner of repair charges covering non-warranty damage, will be made within 30 days of receipt of the instrument at the factory.

ITALKII

What To Do After You Open The Box

1. Connect Your ITALKII

Turn off your computer and disk drive. Locate the two blue connectors coming from ITALKII labeled "3" and "4". Plug these into the joystick ports on the front of your Atari labeled "3" and "4". Now unplug the black connector that's in your Atari's side serial port, and plug this connector into the back of the ITALKII. Plug the remaining ITALKII connector into the Atari's serial port. That's it!

You can leave ITALKII in place forevermore, and use your cassette and disk drive just like before. If you ever need joystick ports 3 and 4, just unplug those two connectors and leave your ITALKII as is. Simple.

2. Listen To Your ITALKII

DISK USERS: With your Basic cartridge installed, boot up SIDE B (reverse side) of the disk you received. A menu will automatically appear. Run the "DEMO" first. We will cover all the other neat things on your disk a little later on.

CASSETTE USERS: On SIDE B of the cassette, at around "120" on your counter (will vary a little from recorder to recorder) is the DEMO program. Type in RUN "C:" to run it.

You might want to run the DEMO a couple of times. Some people have no trouble comprehending ITALKII's "accent", and some people need to listen to it a while to get used to it. In any case, the more you hear it, the easier it is to

ITALKII

understand.

WE HIGHLY RECOMMEND THAT YOU BACK UP YOUR ITALKII SOFTWARE IMMEDIATELY. WE CHOSE NOT TO SOFTWARE PROTECT SPECIFICALLY TO ALLOW BACKUPS. DO IT AS SOON AS POSSIBLE. (Disk users, use DOS menu item J, "Duplicate Disk".)

ITALKII

What's So Great About ITALKII?

Glad you asked.

Not only is ITALKII easy to install and use (as you just found out), it is also very versatile. If you want booming sound, you can connect the audio plug at the rear of ITALKII to the "AUX" input of your stereo amplifier. If you want to vary ITALKII's volume or tone, use the small plastic "screwdriver" included with your unit. While listening to the "DEMO" program, adjust through the small holes labeled "V" and "T" on the bottom of ITALKII. It's fun to play around with the tone adjustment. You can make ITALKII sound like a chipmunk or a dim-witted giant. Select a voice that you find pleasing. This will be the voice you usually hear. When required, however, you can easily access ITALKII's three other, higher pitched voices.

If you have the inclination, you may want to take a peek inside your ITALKII. Just remove the two screws holding the case together and lift off the top cover. Don't poke around in there—just look. We're proud of our well engineered unit. As you can see, ITALKII is very aesthetically pleasing, both inside and out. The quality and care that goes into your ITALKII speaks for itself.

Speaking of speaking for itself, you won't believe how easy it is to make your programs talk (cassette users, it's not quite this easy — you'll see later). After verifying that your "Disk Dictionary" contains all the words you're going to use (we'll talk about this later on), you

ITALKII

simply write your program. Put all desired speech output in a TALK\$. For example, lines 980 and 1000 might read

```
980 TALK$="HELLO. MY NAME IS  
I TALK TOO. I WILL BE YOUR  
GUIDE."  
1000 TALK$="YOU ARE IN A LARGE  
ROOM, ADORNED WITH PURPLE AND  
GOLD TAPESTRIES. ON THE TABLE  
IS AN IRIDESCENT CHALICE."
```

Now all you do is give your program to a utility called the "SENTENCE BUILDER". You'll get back your sentences in translated form - in "ITALKIlese, if you will. You then simply "Enter" into your program the machine language driver called "ITALKII.ENT", and you're ready to go. You'll find that the easiest part of writing your programs is adding speech. More details on this later.

One of ITALKII's best features is the way it runs with Basic. It doesn't tie Basic up at all. ITALKII will speak while graphics are running, while sound effects are going, and so on. This makes ITALKII perfect for fast action games. Take a look at "WORDBLASTER" and you'll see what we mean.

ITALKII

Wordblaster (24KCassette, 32KDisk)

This arcade style game is a good example of how speech can enhance your programs. In fact, this is one game which is effectively made possible by synthesized speech.

As the game begins, ITALKII will ask you to spell a word. Using Joystick 1, shoot the proper letter from the three rows of letters racing across the top of the screen. Each time you make a correct hit, the letter will appear at the very top of the screen, along with a gold star. When you hit an incorrect letter, one gold star will disappear. The object of the game is to get 18 gold stars, at which time you'll get your Wordblaster classification. You can then either stop play, or continue from where you left off.

Wordblaster has several options. The rows of letters at the top of the screen can move at three different speeds, selectable at the game's onset. We'd recommend "SLOW" until you get used to the horizontal scrollong effects.

Disk Users: You can also select your spelling list. You can either utilize an old list, make a new list, or try your hand at some real toughies. The "old list" which comes with your unit is fairly simple. When you get bored with it, or you want to enter your child's weekly spelling list into the game, go for the "enter new list" option. This useful utility lets you enter up to 20 spelling words. Follow the prompts to create your new spelling list. However, prior to entering the list, you must note down the word and its associated encoded phonemes. This is where the Editor

ITALKII

comes in, as you'll soon see.

This new spelling list replaces the "old list" on disk, under the file name "D:WORDS". From that game on, this is your spelling list, unless you either change it or request the "hard words".

Cassette Users: The standard word list will load automatically with your program. Immediately following the Wordblaster program is a list of extremely difficult words. To play these words, Reset the program after the second half of the load is finished, then ENTER "C:". If you would like to enter your own words, LIST out lines 9001-9020 in the program. Here's the format:

```
9001 DATA COMPUTER,3Ib<URfgZjI
      spelling encoded
      word      phoneme
              string
```

Cassette users, we'd recommend that you make up your word list ahead of time. LIST "C:" the list, then ENTER "C:" it after Wordblaster finishes loading.

You'll notice that Wordblaster loads in two sections. That's done to minimize memory usage - there's an enormous amount of data statements and machine language routines which need not be present in the program's body after they are loaded into memory.

Hints and Comments:

1. Any time the letters are not moving, you can hear the spelling word again by pushing the joystick towards the screen.

2. "Lead" your letter when you shoot, particularly on the faster options.

3. Try to avoid shooting near either

ITALKII

edge of the screen, unless you're aiming for the bottom row.

4. If you're stuck, hit the "?" on the bottom row. You'll get the next letter without any penalties whatsoever, but also without any stars.

5. On rare occasions, the projectile's explosion will scatter debris onto a nearby letter, causing Atari to think the wrong letter was hit. So who said life was fair?

6. On equally rare occasions, Atari will be off taking a snooze when you hit the letter. No penalties, no rewards - just shoot again.

7. When you have spelled the word correctly, ITALKII will let you know. Your classification at the end depends on the number of bad hits.

Happy Blasting!

Utilities

Following is a description of the powerful tools you have received with your ITALKII. These tools make it possible for you to add desired words to your Disk Dictionary and to translate English sentences into ITALKIese.

Cassette users, you have an abbreviated utilities package. We're afraid cassettes and data bases don't make an ideal match. In the following, whenever we talk about saving a word to the Dictionary Disk, interpret that as meaning "Write it down".

EDITOR

Run the Editor program (DISK, side B - - - CASSETTE, start of side B). The Dictionary Disk it's talking about on the opening screen is on side A of your disk. Insert side A, then choose #1 on the Editor Menu, "Edit New Word".

1. Edit New Word

Let's add a word to your dictionary. How about "LESS"? Type in "LESS", hit the RETURN key.

Now look up the word "LESS" in your Phonetic Speech Dictionary. Those letters following the "LESS" entry are its phonemes, its pieces so to speak. Type in the phonemes, separated by spaces instead of commas:

L EH1 EH3 S

The Editor is now converting the phonemes into an encoded phoneme string - ITALKIese. This code will appear next to TALK\$:

If you refer to the back of this instruction booklet, you'll see the phonemes and their associated ITALKIese codes. You can easily translate the code "H200" and see that it is, indeed, the phonemes for "LESS".

Press "Y", RETURN to listen. Doesn't sound quite right, does it? Sounds like it needs more "S" on the end. Type in "N" for listening, and "Y" for re-editing the phoneme. Edit just as you would in your programs - move the cursor out past the "S" and add another "S". Hit RETURN. Note that the TALK\$ is now H2000. Listen again. Sounds pretty good. Time to save it to our Disk Dictionary: "N" listen, "N" re-edit, "Y" to save to current dictionary. The word "LESS" is now an official part of your dictionary.

Let's do it again. Select menu item #1, Edit New Word. Enter "LESS" and its phonemes. But this time, enter the phonemes in inverse character (use the key with the Atari logo). Listen to the word, and you'll notice the word sounds higher pitched than before. That's voice#2, as opposed to voice#1 which you heard earlier. In part #5 of this section, we'll discuss voices.

Now answer "N" to listen, "N" to re-edit, and "N" to save to current dictionary. The next prompt is "Save to Different Dictionary (Y/N)?" You'll use this option when you decide to save the word onto a dictionary other than the one you've been using during that editing session. You could conceivably have several different dictionaries - one for general use, one for war games, one for

science fiction games, and so on. When going from one dictionary to the next in an editing session, you should use the "Different Dictionary" option. You would then go back to the "Current Dictionary" option for saving subsequent words onto that dictionary.

Until you become familiar with the phonemes, you'll find the Phonetic Speech Dictionary to be a very valuable guide. Find the word in the Speech Dictionary, enter the phonemes, and then modify the phonemes as required to make the word sound correct. If you enter an invalid phoneme, you'll be notified.

By carefully editing each word going into your dictionary, you can maximize intelligibility. If you can't find your word in the Speech Dictionary, find one with similar sounds and construct your phonemes accordingly. Following are some hints for optimizing your words:

a) Put a short pause (PA0) before words beginning with CH, D, K, P, T, V, or Z.

b) Similarly, put a PA0 after words ending in CH, D, K, P, T, V, or Z.

c) Doubling up on L, M, N, S, and Z helps stress that sound.

d) An ER followed by an R sometimes makes a better "ER" sound.

e) To pluralize words ending in D, add Z S.

f) Putting U1 after an O will sometimes help the "O" sound.

g) Here's one that sometimes helps to put emphasis on the correct syllable: the longer versions on the phonemes, such as EH or UH, seem to produce more emphasis than the shorter forms EH1 or UH1. So you can use two or three short phonemes back to

back if you don't want emphasis on that syllable. The effectiveness of this method varies greatly from word to word.

h) If you want to enter a commonly used phrase in your dictionary, such as "egg sucking dog", separate the words with hyphens, not spaces: "egg-sucking-dog". Spaces are used as word delimiters by the Editor.

You'll be able to store about 3,000 words in your dictionary. That's probably more entries than you will ever need. As you will find out when you add speech to programs, the same common words tend to get used over and over. The 560 word dictionary that came with your ITALKII will probably cover most of your requirements.

Don't worry about hurting your dictionary by "overfilling" it. The Editor will let you know when the disk is full.

The last few pages of this manual contain a list of all the words in your Disk Dictionary, with their associated encoded phonemes. Cassette users will find this a very useful reference for incorporating speech into their programs. In fact, cassette users may want to keep updating this list as they edit new words.

2. Edit Old Word (not available on cassette)

Let's say that upon hearing a word in your program, you're not satisfied with the way it sounds. Or else you misspelled the word in your Disk Dictionary and you want to correct it. Select Editor Menu item #2, "Edit Old Word". Simply type in the word - let's use "LESS". The encoded phonemes will be pulled off disk and translated back to phonemes. You can then change the spelling of the word if desired. Answer

"N" to this, and go on to listen. Let's assume that you think there is too much "S" sound. Just re-edit and save to Dictionary, either Current or New. Note that this mode is very effective for pulling words off of one dictionary and relocating them onto another.

3. Print Words (not available on cassette)

If you select item #3 from the Editor Menu, you can see the words in your dictionary. They'll be displayed on the screen, 20 at a time, with their associated encoded phonemes. Any words which begin with a heart-shape have been deleted and can be cleaned up upon exiting (see part 7 of this section).

4. Delete Words (not available on cassette)

Let's remove that nasty word "LESS". Select item #4 from the Editor Menu, and type in "LESS". After the word is pulled from the disk, you can answer "Y" to delete it. Do so. Now go back and Print Words (item #3 from the Editor Menu). You'll see that heart-shape we mentioned previously.

5. Set Voices

If you get tired of listening to the same old voice, you can change it. Choose #5 from the Editor Menu. As you can see, Voice#1 is currently pitch level 1 and voice#2 is pitch level 2. Voice#2 is engaged by "inverse" phonemes, as you heard earlier.

Answer "Y" to change voices, and enter in any number from 1 to 4 for Voice#1. Do the same for voice#2. 1 is the lowest pitched and 4 is the highest pitched. All words you listen to subsequently with the Editor will be as per these voices you just

set.

6. Create Dictionary (not available on cassette)

If your old dictionary is full, or you want to create some specialty dictionaries, you'll use item #6 on the Menu. Put a formatted disk in the drive and answer "Y" to create the file called "DICTION.ARY". No words can be put on a disk unless this file has been created.

If you leave DOS off the Dictionary Disk, you'll allow more room for words. Put a copy of "Builder" on your new dictionary (see section on "Builder"), and you're ready to go.

7. Exit

To return to Basic, use item #7 on the Menu. Answer "Y" to clean up deleted words. This clean up does more than just that, however. It reorganizes the words on disk to allow for fastest access time. We'd recommend that you implement this function every 30 new words or so. If your dictionary is getting large (>1000 entries), make sure that the "D:MYFILE.LST" and "D:TALK.LST" residing on the Dictionary Disk aren't so large that they leave no room for your dictionary to be rewritten on disk. The number of free sectors left on your disk must be no smaller than the number of sectors occupied by the Disk Dictionary. A disk error will result if your disk doesn't have enough room for clean up. You may just want to delete unused files before cleaning up a large dictionary.

During clean up, one dot will appear on the display for each dictionary word. When "Exit" is complete, the READY prompt

appears and the Editor program is removed from memory.

SENTENCE BUILDER (not available on cassette)

This utility is located on side A of your disk, along with the dictionary. Since Builder uses a dictionary to do its building, we recommend it be present on all your Disk Dictionaries.

"D:UILDER" makes it possible to add speech to your programs. Follow these steps:

1. Start your program at line #20.

2. Write your program so that TALK\$ sentences reside alone on their program lines. No "GOTO", "PRINT", or anything else on that line other than the TALK\$. Write out your TALK\$ in standard sentences, such as

```
752 TALK$="GO AHEAD, TRY AND
HIT IT. YOU CAN DO IT."
```

Spaces between words are ignored by Builder. A comma is treated like a long pause (PA1), and a period, exclamation point, or question mark is treated as a Stop phoneme followed by two long pauses. The words in your TALK\$ sentences must appear **exactly** as they do in the Dictionary Disk.

The Disk Dictionary contains the suffixes ED, ES, EY, ING, LY, TEEN, TION, and WARD. You can use these suffixes to construct words not found in your dictionary. For example, "Seventeen" is not in your dictionary. But you can make it like this:

```
1020 TALK$="SEVEN TEEN"
```

3. Once your program is written, "SAVE" a backup copy on one of your development disks. This is always a good practice.

4. Now "LIST" your program onto the Dictionary Disk. We'd recommend that you use the same name everytime, such as "D:MYFILE.LST". This will maximize disk space available for new words.

5. Run "D:UILDER". When it asks for the name of the file to convert, input your "LIST"ed program name. The next prompt asks if you wish to listen to the TALK\$'s as they're translated, one by one. We'd recommend that you do listen. It gives you a chance to change subtleties, such as pauses between words, to increase intelligibility.

6. The Builder will take it from here. It could take a while, depending on both your program length and your dictionary length. Just kick back and relax. If you elect to listen to the sentences and edit as necessary, note that you must enter the **encoded** phoneme (ITALKIese) in the editing session (refer to the list on the back page of this manual). Builder leaves spaces between the encoded phonemes to simplify editing. When editing, be sure to leave intact either the Stop("o") or Pauses("n") at the end of the TALK\$. Without one of these, the last phoneme keeps right on sounding. Try it and you'll see what we mean.

Builder will progress on through the TALK\$'s in your program. If it happens upon a word it can't translate, it will leave a space in its translation and inform you of the word. The discrepant words and

ITALKII

their line numbers will be displayed after Builder is finished.

7. Builder has now created a list called "D:TALK.LST", composed of all your translated sentences. Type "NEW", then "ENTER" your original program (it still resides, untouched, on the Dictionary Disk). Enter "D:TALK.LST", and your program now contains ITALKIese instead of English words. The only thing you have left to do now is load the ITALKII machine language driver, and call it at the appropriate times.

CASSETTE USERS: Since you don't have a Builder, you have to enter in your TALK\$ in ITALKIese. Use the dictionary list at the back of this manual to provide you with the encoded phonemes for the various words you want. Leave spaces between the encoded words:

```
752 TALK$="K2SHSeggnnn E09Y
_O< [2N3o"
```

These spaces are ignored by the machine language driver, but make it easier for you to come back later and re-edit words. Be sure to end all of your TALK\$'s with either a Stop("o") or a Pause("3" or "n"). Without one of these, the last phoneme doesn't shut up.

ITALKII

ITALKII DRIVER

This little gem is located on side B of your disk (CASSETTE-side B, around 100). Just ENTER "D:ITALKII.DRV" (ENTER "C:") into your program. It occupies lines 1 through 6. It may look like gobblygook to you, but it's music to Atari's ears. In the next section, we'll discuss how to call this routine.

Making Your Programs Talk Back

At this point, you've got ITALKIIfese in your program with something called "ITALKII.DRV" located at the program's beginning. Now to make it talk.

As your program executes, it will encounter the various TALK\$'s scattered throughout. Call the USR function as follows to engage speech:

```
752 TALK$="K2SHSeggo"
753 X=USR(ADR(DRIVER$),ADR(TALK$),
LEN(TALK$),VOICE1,VOICE2)
```

Don't worry about all that "ADR" and "LEN" stuff in the call - it just passes along certain necessary information to the machine language routine. Simply type that part in just as you see above. What you have to decide on is which pitch voice to use. Enter a number from 1 to 4 for VOICE1, and from 1 to 4 for VOICE2. As we discussed earlier, 1 is the lowest pitch and 4 is the highest pitch. VOICE2 is spoken whenever the machine language routine sees a TALK\$ in "inverse". As you see, you can change voice complements at every USR call if you want to. In the programs we've written, however, we tend to use just one set of voices throughout. What we do is put the USR call right near the program's beginning, say line number 8, followed by a "RETURN" statement:

```
8 X=USR(ADR(DRIVER$),ADR(TALK$),
LEN(TALK$),1,2):RETURN
```

Now, whenever we want speech, we just

GOSUB 8

Pretty easy, huh?

If you call a new TALK\$ before the old one is finished, the new one will rudely interrupt. If this is not desired, put in these lines:

```
9 IF LEN(TALK$)>PEEK(207) THEN 9
10 RETURN
```

When no interruptions are desired, just

GOSUB 9

Note that although the actual talking does not occupy Basic at all, this "waiting to finish" does. So if you are anxious to start the new TALK\$, but you've got some graphics happening on the screen, you may want to just "poll" the status of the current TALK\$ every so often:

```
1010 GOSUB DRAWLINE
1020 IF LEN(TALK$)>PEEK(207) THEN
1010
1030 TALK$="3UIk00o"
1040 GOSUB 8
1050 GOSUB DRAWLINE
```

Advanced Programmers

This section is for those of you familiar with wierd things like assembly language and interrupt driven routines. Everyone else might want to skip over this section, unless you enjoy being bored to tears.

The ITALKII driver is a vertical blank interrupt driver routine. When the USR call is executed, the current VVBLKD at address \$0224 is stored in page 0, at \$CD and \$CE. The VVBLKD is then changed to point to the ITALKII driver. Every 60th of a second, the driver checks to see if it needs to pull the next element from the TALK\$. After finishing with that, it jumps to the routine whose address it had so wisely stored in \$CD. When the driver reaches the end of the TALK\$, it checks to make sure that its address is still in \$0224. If it's not, that means that some other latecomer routine is busily running on 60 HZ interrupt. So good old ITALKII allows the other routine to finish up and reset the VVBLKD. Then ITALKII resets VVBLKD back to (\$CD), and gets itself out of the 60 HZ loop.

If you plan on implementing your own vertical blank interrupt routines, be sure to nest them as described above. That way, some poor unsuspecting routine won't be cheated out of completing its work.

Note that the ITALKII driver uses page 0 locations \$CB,\$CC,\$CD,\$CE, and \$CF. That really only leaves locations \$D0 and \$D1 for your program. Too bad Atari didn't get to leave more of page 0 open. The 6502's indirect addressing modes are certainly demanding little tykes.

What The Heck Is A Phoneme, Anyway?

Phonemes and words are like notes and music. Just as music can be broken down to a set of notes, so words can be broken down to a set of phonemes. In fact, with a set of about 64 of these little phonemes, virtually any Germanic word and most Romanic words can be synthesized (that's English, French, Italian, and Spanish, to name a few).

Lo and behold, guess how many phonemes ITALKII can articulate. Yep-64. This gives ITALKII a virtually unlimited vocabulary. Whereas a limited vocabulary is all that's needed by vending machines and elevators, a home computer needs a vast vocabulary. No telling what warped applications will next be forced on the poor, defenseless computer.

ITALKII

It's The Hardware, And A Lot More

If you're the curious type, you've probably already looked inside the ITALKII. If not, you'll be pleased to hear that there is a lot more inside than the weight would lead you to believe.

The largest component is a speech processor integrated circuit. That circuit modulates a fundamental frequency in a way dictated by phoneme data from your computer. The output of the integrated circuit is a modulated frequency waveform - speech.

So what does all the rest of the circuitry do? That's where the real magic comes in. Those circuits allow you to use the speech processor without limiting any of the other capabilities of your system. Temporary data storage buffers and hardware/software handshake logic allow the speech synthesizer to operate without disturbing the action on the screen. Protection circuits guard the ITALKII against misconnected cables and component-killing static electricity. The audio stage allows you to adjust speech volume to match the volume of your computer's sound generators. It also adds in the sound track of your cassette player and then outputs the combined signal to your monitor and an auxiliary output jack. The auxiliary output can be connected to any power amplifier to produce booming sound.

The superior performance of ITALKII is due to not only its well engineered electronics, but also to its hardware/software interaction. A lot of technology for such a little box!

BLOCK DIAGRAM
I TALK II

Troubleshooting

If ITALKII fails to produce speech when used with its DEMO program, the problem is probably in interconnecting cables. Check to be sure all three connectors are fully seated and in the correct locations. If you find that Fido has chewed a hole in your cable or you can't find the problem, talk to your dealer. The ITALKII modular design and factory available repair kits make repair a snap.

Ideas

There are all sorts of great things speech can be used for. How about a keyboard annunciator for the visually handicapped? Or even a "Blind Basic"? How about adventure games, in which ITALKII is the dungeon master?

What about an interactive psychiatric-type program, in which the computer responds vocally to your complaints and statements? Beats \$50 an hour.

Or how about using ITALKII to make wierd sound effects, particularly in conjunction with Atari's sound generators. We're just beginning to explore that one.

Let us know if you come up with a great program for ITALKII. Ask for information on our software royalties plan.

Watch for the new, stimulating software coming soon for your ITALKII.

The last word in speech synthesis
ITALKII.

PHONETIC SPEECH DICTIONARY for the SC-01 SPEECH SYNTHESIZER

INTRODUCTION

VOTRAX[®] Speech Synthesis Technology produces each of the 45 basic speech sounds, called phonemes. This handy dictionary gives you quick access to the VOTRAX[®] phoneme sequences used to create approximately 1400 words. Because VOTRAX[®] speech synthesis uses these basic phonetic sounds, you may program virtually any word in the English language by learning to use and combine the various phoneme codes.

This dictionary is intended for use with the SC-01 Speech Synthesizer. It can also serve as a guide for programming any product containing a VOTRAX[®] synthesizer.

GENERAL DESCRIPTION OF THE SC-01 CHIP

The SC-01 Speech Synthesizer is a completely self-contained solid state device. This single chip phonetically synthesizes continuous speech, of unlimited vocabulary, from low data rate inputs.

Speech is synthesized by combining phonemes (the building blocks of speech) in the appropriate sequence. The SC-01 Speech Synthesizer contains 64 different phonemes which are accessed by a 6-bit code. It is the proper sequential combination of these phoneme codes that creates continuous speech.

PHONEME DESCRIPTION

Table 1 lists the 64 phonemes produced by the SC-01. Each sound is represented by its VOTRAX[®] phoneme code and is accompanied by its phoneme symbol and an example. The underlined segments of the example word demonstrate the phoneme use, i.e., sound to be pronounced.

Table 2 provides the phoneme sequences used to produce vowels in the group called diphthongs, (2 vowel sounds in sequence, identified as a single sound, e.g., the long "i" vowel).
