Preface

PILOT (Programmed Inquiry Learning Or Teaching) is a simple, but powerful, programming language developed in the 1960s by Dr. John Starkweather (University of California Medical Center, San Francisco). Designed specifically for education, the primary audience was teachers who wanted to develop computer-based education programs. However, because of PILOT's simplicity, it was found to be an excellent introductory programming language for children as well as adults. Dr. Dean Brown, then head of SRI's Educational Technology Laboratory, began using PILOT with elementary school children in the late 1960s and found that children as young as six and seven loved to write their own PILOT programs. Dean Brown's work also convinced the Lawrence Hall of Science's Computer Education Project (Bob and Ted Kahn, Pete Rowe, Keith Vann, and others) to use PILOT as the main language for working with elementary-school-aged children.

The development of microcomputers allowed new and wonderful worlds to merge graphic images and music. Dr. Seymour Papert (MIT), one of the inventors of the Logo programming language, developed the use of computers as "microworlds of exploration." He developed a concept called "turtle graphics," an elegant mathematical system which is easy enough for any child to use to create beautiful dynamic works of art.

When the Atari Corporation developed its own version of PILOT for ATARI Home Computers, it took the best of the ideas of each of these outstanding educators. Harry Stewart, who implemented ATARI PILOT, included the turtle graphics system from Logo and the standard X-Y coordinate graphics, and he added a sound command to allow PILOT to make music. Dave Thornburg offered very helpful advice about some important additions to PILOT's commands. Bob and Ted Kahn helped develop manuals and tutorial materials, as well as examples of programs in PILOT which would help users see the versatility of this language. The result is an outstand-

ing programming language, one which can be used by both children and adults for entertainment and education. We hope *ATARI® PILOT Activities and Games* will help show ATARI Computer users how versatile PILOT is and that it will also help develop ideas of "modular programming." We suggest that this book be used in conjunction with the two manuals which are available with the purchase of ATARI PILOT: *The ATARI 400/800™ PILOT Primer* and *ATARI 400/800™ Student PILOT: Reference Guide.*

"Deeper meaning often lies in child's play."
—Schiller

ATARI® PILOT Activities and Games

1 PILOT: A Simple Language That Can Do Complex Things

Introductory Notes

ATARI® PILOT is a simple language to master and is therefore very useful for teachers and other people, young and old, who are new to programming. Also, the ATARI PILOT cartridge contains "turtle graphics," which makes it easy to master some of the powerful aspects of ATARI Computer graphics, including drawing and animation.

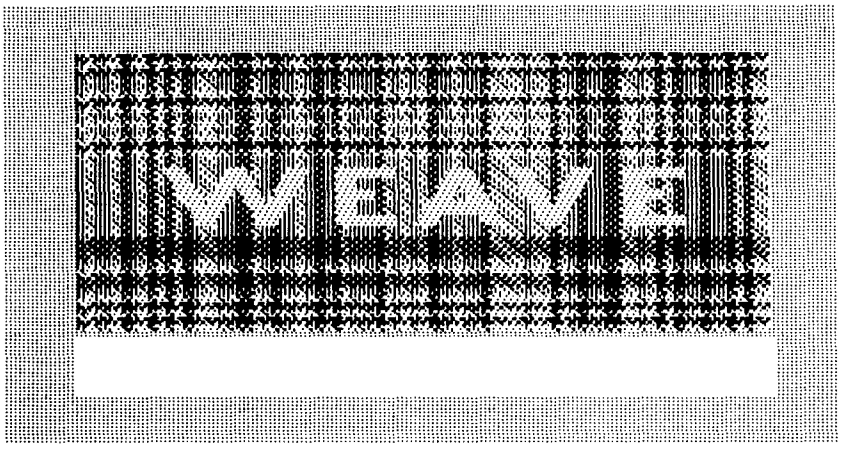
The simplicity of PILOT, however, does not mean that you can do only simple programming in the language. In fact PILOT is structured so that the programmer can design quite complex programs, add new structures (called modules) to the language, and use them in any number of different programs. We will show how to use PILOT to build complex programs throughout this book as well as provide dozens of games, both educational and recreational, that you can copy and use on any ATARI Computer with the ATARI PILOT cartridge.

However, we will assume that you have not had much experience with PILOT. If you have already mastered PILOT, you can skip the introductory section and begin to sample some of the programs in the book. We have provided language, math, and logic games as well as music and graphics programs. There is also a section on miniworlds and adventure games, where you can discover how PILOT can be used to develop adventures and simulations. We have also included explanations of how to examine and change the contents of certain memory locations (equivalent to ATARI BASIC PEEK and POKE commands) so that PILOT can take advantage of some of the features of the special chips in the ATARI Computer.

In addition to explaining programs and giving their listings (for our listing notation, please turn to Appendix I—you won't need it for awhile, and we'll let beginners know when

*ATARI is a registered trademark of Atari, Inc. (a Warner Communications Company), used by permission.

they need to use it), we have made screen dumps of most programs in the book. A *screen dump* is a computer printout of exactly what you see on the screen when you use (RUN) a program. It is not a listing of the program but a picture of the program in action. For example, see the illustration of a screen dump of the introduction to a PILOT program, included in this book, that allows you to weave your own patterns. These screen dumps are included to help you visualize what the programs in the book do.



In addition to providing these illustrations, we have included suggestions on how you can modify your programs or dress them up. It is important to take control of programming as well as use other people's programs, and we encourage you to become a creative and playful programmer. PILOT is particularly suited to getting first experiences in programming, as you will see.

Preliminary Commands and Techniques

You should know a few simple commands and techniques before you begin programming. In PILOT, like most other computer languages, each line of a program must have a line number if it is to be stored in the computer's memory. In PILOT any integers from 0 to 9999 can be used as line numbers. No matter what order you type your lines in, the computer reorders them from smallest to largest and uses them in that order. Thus if you number your lines

0 _____
99 _____
6 _____
2 _____
5 _____

the computer will reorder and use them in this sequence:

0 _____
2 _____
5 _____
6 _____
99 _____

Two PILOT operating commands need to be memorized: RUN and LIST. You type LIST when you want to see all the numbered lines that make up a program. You type RUN when you want to use a program. After typing either LIST or RUN, you press [RETURN] to see the program list or use the program. Finally you type NEW and press [RETURN] if you want to erase a program from your computer's memory.

The Core of PILOT

In PILOT a number of simple commands can be combined to make complex and interesting programs. In this section we will build a simple adventure game from a core PILOT vocabulary and show how to modify that game to make it more complex and interesting without using additional vocabulary. If you follow the development of this game and type it into the ATARI Computer as it grows, you should develop a feel for the ease of programming in PILOT. We'll begin with the following three comands:

T:
A:
M:

T: instructs the computer to "Type" or print anything that comes after it, including spaces on the screen, as the following example indicates:

```
10 T:GUESS WHAT THE NEXT SENTENCE SAYS
20 T: GUESSWHATTHENEXTSENTENCESAYS
```

When you type RUN and press [RETURN] the screen will look like this:

```
GUESS WHAT THE NEXT SENTENCE SAYS
 GUESSWHATTHENEXTSENTENCESAYS

READY
```

If you want to space out the two sentences or any two T: lines in your program, you simply add any empty T: where you want the line skipped. Then your program would look like this:

```
10 T:GUESS WHAT THE NEXT SENTENCE SAYS
15 T:
20 T: GUESSWHATTHENEXTSENTENCESAYS
```

The screen dump shows what the empty T: would do to the program when you RUN it.

```
GUESS WHAT THE NEXT SENTENCE SAYS
 GUESSWHATTHENEXTSENTENCESAYS

READY
```

You'll notice throughout the programs in this book many empty T: statements. These are used to make the program more readable and visually elegant when it appears on the screen.

The next two commands are A: (the Accept or PILOT input command) and M: (the Match command), which is unique to PILOT. A: lets the user put a number, letter, or word into the computer's memory. M: lets you match (compare) that number, letter, or word with a list that you type after M:.

Here are several of the infinite number of match lists that you could create while inventing games, puzzles, or other programs:

```
M: 2,4,6,8,10
M: 1,3,5,7,9
M: A,E,I,O,U
M: LION, TIGER, CAT, CHEETAH
```

Notice that there *must* be a comma between each item in a match (M:) statement.

When you input something into an A: statement followed by an M: statement, you will either have a match or you won't.

- Y indicates there is a match.
- N indicates there is no match.

The Y and N match features are unique characteristics of PILOT. Understanding how they work should give you a feel for some of the structural power of PILOT. Y and N are never found in programs by themselves. They are used in conjunction with another command that tells you what to do if there is (or isn't) a match. T: is one of the commands with which they can be used. TY: tells the computer what to print if there is a match. TN: tells it what to print if there is no match to the M: statement. Here are two examples that should clarify how Y and N work:

```
10 T:HOW OLD ARE YOU
20 A:
30 M:1,2,3,4,5
40 TY:ITS GOOD TO BE YOUNG
50 TN:SORRY YOU'RE SO OLD ALREADY
```

```
10 T:HOW ARE YOU FEELING?
20 A:
30 M:GOOD,FINE,OK,WONDERFUL
40 TY:GLAD TO HEAR IT
50 TN:HOPE YOU FEEL BETTER TOMORROW
```

In the first example, if you type 1, 2, 3, 4, or 5 in the A: line, you will have a match; the program will go to line 40 TY: and print out IT'S GOOD TO BE YOUNG. If you type any other number, the program will go to line 50 TN: and print out:

SORRY YOU'RE SO OLD ALREADY.

Try to analyze how the second program works and write a few programs using T:, M:, A:, TN:, and TY:.

A summary follows of these core PILOT ideas to refer to in case you need to refresh yourself on how they are used.

```
          THE CORE OF PILOT:1

Commands          Meaning

   T:             Type or print

   A:             Accept as input
                  a number or word

   M:             Match what is put
                  in A: with a list
                  of words or numbers
                  put after M: and
                  separated by commas.

READY
```

```
THE CORE OF PILOT:II

Conditionals          Meaning

   Y                  This is used if
                      a valid match is
                      made.
                      It can be used with
                      T: in the form TY:

   TY:                If a match is made
                      then whatever follows
                      TY: is printed

READY
```

```
THE CORE OF PILOT:III

Conditionals          Meaning

   N                  This is used if
                      n0 valid match can
                      be made.
                      It can be used with
                      T: in the form TN:

   TN:                If no match is made
                      then whatever follows
                      TN: is printed

READY
```

Building Our Adventure

With a few more simple bits of PILOT, we will be able to build our adventure. Let's begin by taking a look at A:, the PILOT input command. A: can accept numbers (actually only positive and negative integers), letters, and words. Sometimes A: is used a number of times in a program, and the kind of input that it receives needs to be named and used in different parts of a program. The way to name variables that are input into a program is to use the following:

- *For letters and words:* A:$ followed by a name such as A:$ANIMAL or A:$CAR or A:$NAME
- *For numbers:* A:# followed by a single letter such as A:#X or A:#B or A:#C

Two short programs illustrate how variables are used with the A: command.

```
10 T:WHAT IS THE LARGEST CAT?
20 A:$CAT
30 M:LION
40 TY:RIGHT, $CAT IS THE LARGEST CAT
50 TN:SORRY IT IS NOT A $CAT
```

In the first program the variable name is $CAT. Notice that $CAT appears on both lines 40 and 50. If you answer the

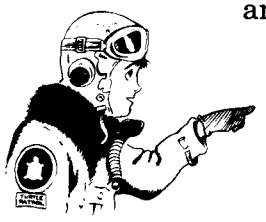
question on line 10 by typing lion, you will get a match; the computer will go to line 40 and type out

RIGHT, LION IS THE LARGEST CAT

If on the other hand you type in tiger, there will be no match; the computer will go to the TN: statement on line 50 and type

SORRY IT IS NOT A TIGER

Notice that $CAT functioned just like a word in the TY: and TN: statements. The only difference is that it is a variable and therefore it becomes whatever you type in on line 20.



Here's a short number variable program:

```
10 T:WHAT NUMBER IS HALF WAY BETWEEN
20 T:10 AND 20?
30 A:#G
40 M:15
50 TY:YOU ARE RIGHT
60 TN:SORRY #G IS NOT CORRECT
```

If you type in 15, there will be a match and the computer will type out

YOU ARE RIGHT

If you type any other number, such as 22 or 17, there will be no match; the computer will print at 60

SORRY 22 IS NOT CORRECT

or SORRY 17 IS NOT CORRECT

Here are two other simple programs using variables. Copy and RUN them to get a sense of how variables work in PILOT; then change them and experiment with your own programs, using the core PILOT vocabulary introduced so far.

```
10 T:WHAT IS THE SMALLEST BIRD?
20 A:$BIRD
30 M:HUMMINGBIRD
40 TY:RIGHT, $BIRD IS THE SMALLEST BIRD
50 TN:SORRY,$BIRD IS NOT THE SMALLEST BIRD
```

```
10 T:WHAT NUMBER IS HALF OF TWENTY?
20 A:#X
30 M:10
40 TY:YOU ARE RIGHT
50 TN:NO #X IS NOT HALF OF 20
```

```
THE CORE OF PILOT:IV

Variables          Meaning

  A:$NAME          This is used when
                   you name a letter
                   or word input
                   variable.

  A:#X             This is used when
                   you name a number
                   variable. The name
                   should be one letter.

READY
```

Now we can start on the adventure. As it develops, new PILOT vocabulary will be introduced. By the time we've finished the miniadventure, you should have most of the core vocabulary of PILOT mastered and be able to do many programs of your own. In addition to providing dozens of programs that you can copy and use, we'll introduce you to programming computation, sound, graphics, and animation in ATARI PILOT.

We'll begin the adventure by asking the player for his or her name and finding out whether he or she wants to play:

```
10 T:WHAT IS YOUR NAME?
20 A:$NAME
25 T:
30 T:$NAME DO YOU WANT AN ADVENTURE?
40 A:$ANSWER
50 M:YES
60 TY:WELL HERE WE GO
70 TN:SORRY MAYBE SOME OTHER TIME
80 E:
```

Notice that two variables, $NAME and $ANSWER, have been used, each referring to a different match statement. Also note a new PILOT command; E: on line 80 follows the statement SORRY MAYBE SOME OTHER TIME. E: is a command that ends a program (or, as we'll see later, part of a program). If a person doesn't want to play, the program stops.

In another look at the program, if someone wants to play, we must jump into the game; that should take place right after the computer prints WELL HERE WE GO, that is, between lines 60 and 70.

```
10 T:WHAT IS YOUR NAME?
20 A:$NAME
25 T:
30 T:$NAME DO YOU WANT AN ADVENTURE?
40 A:$ANSWER
50 M:YES
60 TY:WELL HERE WE GO
```

Jump in

```
70 TN:SORRY MAYBE SOME OTHER TIME
80 E:
```

That's exactly what happens in PILOT. You can jump from one part of a program to another using the jump command J: or the jump command with a match statement:

- JY: (jump if there is a match)
- JN: (jump if there is no match)

Y and N function with J: in the same way that they function with T:.

Using Modules

In many computer languages the rough equivalent of J: refers to a line number. For example, in BASIC the GOTO command instructs the computer to go to the line number written after the command. GOTO 100 means go to line 100 in the program and do whatever it says. *There are no references to line numbers within programs in PILOT.* Instead there are *modules* that you create and name. These modules are like new words or functions that you create for your programs. You can use them repeatedly at different parts in your program. With programming in PILOT one must learn how to *think modules.* As you'll see soon, if you can read the modules in a program and see how they are used, you can quickly understand long and seemingly complex programs.

Each module has a name that is preceded by an asterisk (the multiplication sign on the ATARI Computer keyboard). You can name your modules in any way that you want by using numbers and upper-case letters as long as they do not have any spaces in them. Thus possible module names could be: *FRIEND, *FRIENDSHIP, or *2FRIENDS, but *not* *FRIEND SHIP.

THE CORE OF PILOT:V

Commands	Meaning
E:	End a program
*MODULE	Name a module
J:*MODULE	Jump to *MODULE
JY:*MODULE	Jump to *MODULE if there is a match
JN:*MODULE	Jump to *MODULE if there is no match

■

This short program should give you a good idea of how to read a PILOT program that uses modules and jumps. It is a good idea to skim a PILOT program listing, look for the modules that it contains, and then return to the beginning lines and see how they are used. In many of the programs in this book we'll indicate the modules by placing a bracket to the left of their listing, as in this program.

```
10 T:WHICH COLOR DO YOU LIKE BETTER
20 T:
30 T:RED OR YELLOW?
40 J:*GUESS
50 *GUESS
60 A:
70 M:RED
80 JY:*RED
90 M:YELLOW
100 JY:*YELLOW
110 *RED
120 T:YOU HAVE A HOT TEMPER
130 E:
140 *YELLOW
150 T:YOU ARE QUITE INSIGHTFUL
160 E:
```

This program asks you whether you prefer red or yellow and then jumps to either a red answer (*RED) or a yellow answer (*YELLOW). The beginning lines introduce the program. It would be easy to add more colors by simply creating new modules such as *BLUE or *PURPLE or *ORANGE. One advantage of PILOT is that it is easy to build up complexity by adding simple modules to a program.

Let's return to our monster adventure, which we begin with this introduction:

```
10 T:WHAT IS YOUR NAME?
20 A:$NAME
25 T:
30 T:$NAME DO YOU WANT AN ADVENTURE?
40 A:$ANSWER
50 M:YES
60 TY:WELL HERE WE GO
70 TN:SORRY MAYBE SOME OTHER TIME
80 E:
```

Notice that we have added at line 65 a command to jump on a match to a module *MONSTER. That module will start us on our adventure.

We'll begin the module on line 100:

```
100 *MONSTER
```

This module, like all PILOT modules, can be either simple or complex and can deal with words, numbers, music, graphics, or animation. One can begin with an extremely simple module and make it more complex as you have new ideas. Throughout this book you'll see modules of varying complexity, and we'll give hints on how to distinguish modules and modify them.

A good programming trick that often comes in handy at the beginning of a module is to clear the screen so that it won't look cluttered and too full of print. You can clear the screen at any point of a program by writing the following command:

T: [ESCAPE] [SHIFT CLEAR]

What this means is that you type T:, then press the [ESCAPE] key, followed by pressing the [SHIFT] and [CLEAR] keys simultaneously. What you will see on the screen is

T:↱

In our program notations we will represent T:↱ by the processes that you must perform. According to the notation in Appendix I, T: ↱ will be printed

T: [CLEAR]

The module looks like this so far:

```
100 *MONSTER
110 T:[CLEAR]
```

Now we must decide what we want the monster to say or do. If you know how to use PILOT sound and graphics, you could start with mysterious music and the face of your monster. However, we'll start simple here, though it may be a good idea for you to return to this program after you've read the sound and graphics chapter and make *MONSTER fancy.

```
120 T:YOU ARE TAKING A WALK ONE DAY AND
130 T:
140 T:MEET A MONSTER. IT COMES UP TO YOU
150 T:
160 T:AND BREATHES SMOKE IN YOUR FACE. IT
170 T:
180 T:SAYS,"WHAT ARE YOU DOING BOTHERING"
190 T:
200 T:ME?"
210 T:
220 T:WHAT DO YOU DO?
230 J:*VOCAB
```

Putting the parts of the program together, here's what we have so far:

```
10 T:WHAT IS YOUR NAME?
20 A:$NAME
25 T:
30 T:$NAME DO YOU WANT AN ADVENTURE?
40 A:$ANSWER
50 M:YES
60 TY:WELL HERE WE GO
65 JY:*MONSTER
70 TN:SORRY.  MAYBE SOME OTHER TIME.
80 E:
100 *MONSTER
110 T:
120 T:YOU ARE TAKING A WALK ONE DAY AND
130 T:
140 T:MEET A MONSTER. IT COMES UP TO YOU
150 T:
160 T:AND BREATHES SMOKE IN YOUR FACE. IT
170 T:
180 T:SAYS,"WHAT ARE YOU DOING BOTHERING"
190 T:
200 T:ME?"
210 T:
220 T:WHAT DO YOU DO?
```

At this point we must decide on the vocabulary to be allowed in the adventure. We could choose any number of words, but for the sake of simplicity we will use three and let the player know what they are. To do this we'll create a vocabulary module called *VOCABULARY and jump to that module at line 230:

```
230 J:*VOCABULARY
```

Here's the module using the words CRY, SMILE, and FROWN. Notice that each of these three words leads to a module of its own: *CRY, *SMILE, and *FROWN. In that way the program uses matches and jumps to build up the whole structure.

```
710 *VOCAB
720 T:
730 T:  HERE ARE THE WORDS YOU CAN USE
740 T:
750 T:  CRY      SMILE      FROWN
760 T:
770 T:  WHAT WILL YOU DO?
780 A:
790 M:CRY
800 T:[CLEAR]
810 JY:*CRY
820 M:SMILE
```

```
830 T:[CLEAR]
840 JY:*SMILE
850 M:FROWN
860 T:[CLEAR]
870 JY:*FROWN
```

At this point the program on your screen would look like the following screen dump.

```
JOSHUA DO YOU WANT AN ADVENTURE?
YES
WELL HERE WE GO
YOU ARE TAKING A WALK ONE DAY AND
MEET A MONSTER. IT COMES UP TO YOU
AND BREATHES SMOKE IN YOUR FACE. IT
SAYS,"WHAT ARE YOU DOING BOTHERING"
ME?"
WHAT DO YOU DO?
  HERE ARE THE WORDS YOU CAN USE
  CRY      SMILE      FROWN          ■
  WHAT WILL YOU DO?
```

Here are the modules for the three words that we chose:

```
230 J:*VOCAB
240 *SMILE
250 T:
260 T:
270 T:
280 T:YOUR SMILE HAS MELTED MY HEART
290 T:
300 T:I WILL LET YOU START THE ADVENTURE
310 T:
320 T:AGAIN
330 J:*MONSTER

340 *FROWN
350 T:
360 T:
370 T:
380 T:YOUR FROWN HAS ANGERED ME.
390 T:YOU BETTER RUN OR I'LL EAT YOU.
400 T:I AM KINDER THAN YOU THINK.
410 T:YOU CAN START ALL OVER AGAIN.
420 J:*MONSTER

430 *CRY
440 T:
450 T:
460 T:
470 T:I AM A FEROCIOUS MONSTER....BUT
480 T:
490 T:BUT I CAN'T STAND CRYING...HERE
500 T:
510 T:TAKE MY TREASURE.
520 J:*TREASURE
```

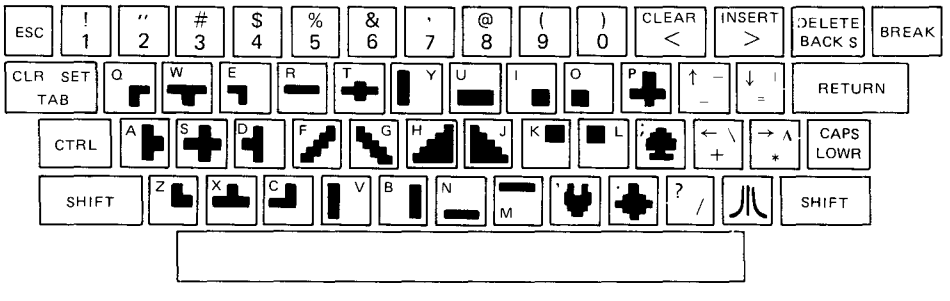
Notice that if you decide to smile or frown, you jump back to *MONSTER, but if you decide to cry, you go to the last module in the program, *TREASURE, and get the treasure. You can make the treasure anything that you want. Here's an empty treasure module with lots of T: commands left blank for you to fill in with words or with ATARI Computer character graphics, sound, or turtle graphics, all of which you'll learn about in this book:

```
530 *TREASURE
540 T:
550 T:
560 T:
570 T:
580 T:
590 T:
600 T:
610 T:
620 T:
630 T:
640 T:
650 T:TO START AGAIN TYPE HELLO
660 A:$HELLO
670 M:HELLO
680 T:[CLEAR]
690 JY:*MONSTER
700 E:
```

Here's a simple treasure that we drew using the control graphics keyboard on the ATARI Computer. All the graphics on the keyboard can be incorporated into your programs, which makes it easy to be fancy.

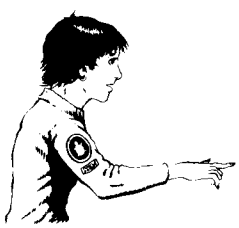
```
530 *TREASURE
540 T:
550 T:
560 T:
570 T:
580 T:
590 T:
600 T:
610 T:
620 T:
630 T:
640 T:
650 T:TO START AGAIN TYPE HELLO
660 A:$HELLO
670 M:HELLO
680 T:[CLEAR]
690 JY:*MONSTER
700 E:
```

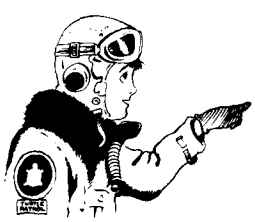
The following drawing illustrates the graphics characters that you can use simply by pressing CONTROL, that is [CTRL], at the same time as pressing the indicated keys.



Notice lines 650 to 690 in *TREASURE. They give the option of replaying the game by typing the word HELLO.

Putting all the pieces together, here is how the program looks. Notice that, though it's very long, if you look at each module as a unit, you can easily figure out how the program works. Modules are like words that you've created; in fact the power of PILOT is that by building your own modules you are creating your own language for the computer to use.





```
10 T:WHAT IS YOUR NAME?
20 A:$NAME
25 T:
30 T:$NAME DO YOU WANT AN ADVENTURE?

Try to read this program and figure out how it works. Then try to turn it into a space adventure or pirate adventure. Change the vocabulary or add to it. You will find it easy to make your own simple adventures. Throughout the rest of the book we'll show how to add to the core PILOT ideas presented here and make your own games and adventures. We'll also give you dozens of games and other programs that you can copy, modify, and use. It would be a good idea to try to read and understand the programs before copying them so that you see how the module structure works.

More Core Ideas

There are a few more core PILOT ideas to master. Then we'll be ready to plunge into graphics, sound, and color. These are the remark statement R: and the use module U:. The remark R: statement is used to help you read and understand the structure of a program. It is *not* really a part of the program and does not affect it in any way. Instead it is a programmer's way to mark out blocks in a program and help others understand how the program works. Here is a simple program that we used before, with R: statements added.

```
10 R:COLOR CHOICE PROGRAM
20 T:WHICH COLOR DO YOU LIKE BETTER
30 T:
40 T:RED OR YELLOW?
50 R:INPUT OF COLOR CHOICE
60 T:
70 A:
80 M:RED
90 JY:*RED
100 M:YELLOW
110 JY:*YELLOW
120 R:RED MODULE BEGINS HERE
130 *RED
140 T:YOU HAVE A HOT TEMPER
150 E:
160 R:YELLOW MODULE BEGINS HERE
170 *YELLOW
180 T:YOU ARE QUITE INSIGHTFUL
190 E:
```

Finally there is the U:, or use, command. This is very convenient when a module is used many times in a program. It is essential that *each module referred to by a U: command is ended with an E: command.* If not, your program will run on to the lines after the module and might become hopelessly confused. Here's a version of the color choice program with an additional module called *SUMMARY, which is used at the end of the program regardless of the color chosen.

```
170 *SUMMARY
180 T:SEE HOW COLOR AFFECTS PERSONALITY?
190 T:ADD MORE COLORS TO THIS PROGRAM.
200 T:THINK ABOUT COLOR AND PERSONALITY.
210 E:
```

Here's how it can work, taking advantage of the power of the U: command.

```
10 T:WHICH COLOR DO YOU LIKE BETTER
20 T:
30 T:RED OR YELLOW?
40 A:
50 M:RED
60 UY:*RED
70 M:YELLOW
80 UY:*YELLOW
90 U:*SUMMARY
100 E:
110 *RED
120 T:YOU HAVE A HOT TEMPER
130 E:
140 *YELLOW
150 T:YOU ARE QUITE INSIGHTFUL
160 E:
170 *SUMMARY
180 T:SEE HOW COLOR AFFECTS PERSONALITY?
190 T:ADD MORE COLORS TO THIS PROGRAM.
200 T:THINK ABOUT COLOR AND PERSONALITY.
210 E:
```

Notice that at line 60 there is a UY: command, which functions like a JY: command. It instructs the computer to use * RED if there is a match, just as line 80 says UY:*YELLOW and instructs the computer to use the module *YELLOW.

At the end of each module is an E: command. The E: command must end each module referred to by the use command U:. After the module is used, the program jumps back to the line after the command and continues to run. The E: at the end of the module in effect returns the program to the line after the U: statement. Look at the arrows in the following program. The first arrow shows how the program uses the *RED module. When that is done, the program returns to line 90 (since there is no match with YELLOW). Line 90 then directs the computer to use the module *SUMMARY. After it is used, the program returns to line 100 and ends. This might not be clear the first time that you study it but try to play with U: statements, as they make it possible to use a module many times within a program and therefore save much time and effort when you're trying to create complex programs.

```
10 T:WHICH COLOR DO YOU LIKE BETTER
20 T:
30 T:RED OR YELLOW?
40 A:
50 M:RED
```

```

A summary of U: and R: follows.

```
THE CORE OF PILOT:UI

R:              The remark command
                lets you label your
                programs for your own
                convenience. It is not
                part of the program.

U:*NAME         The USE command makes
                your program use a
                specific module (in
                this case *NAME) and
                then return and go on
                with the rest of the
                program.
UY:*NAME        Use a module if there
                is a match.
UN:*NAME        Use if there is no
                match.
(UY: & UN: are similar to JY: & JN:)
```

At this point all the core commands in PILOT have been presented and illustrated. A summary of them follows. If any puzzle you, go back over the chapter and try to develop programs of your own similar to the ones that we have presented. The best way to become comfortable with programming is by creating your own programs.

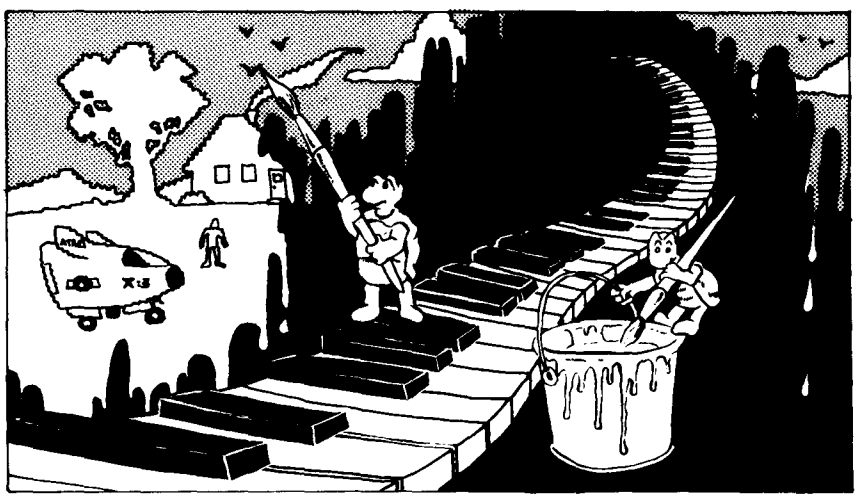
A:$NAME	UY:*NAME
A:#X	UN:*Name

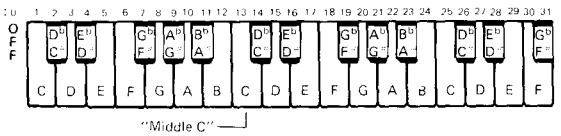
2 PILOT Sound and Graphics



ATARI PILOT Sound

Sound and music are very easy to create with ATARI PILOT. The sound command is simply SO:. SO: lets you create musical tones on your computer. You can program up to four tones to play at the same time. Each separate tone is then called a *voice.* When people get together to sing, they divided into several *voices:* bass, baritone, alto, and soprano. When you program SO: commands, you can program several voices to play together. When different voices play a sound at the same time, that sound is called a *chord.*

The tones that you can play in PILOT range from 0 to 31. If you enter the command SO:13, you will hear a single tone equal to middle C on the piano. The command SO:1 produces a tone equal to the note C, one octave below middle C. The command SO:31 produces the note F sharp, one octave above middle C. SO:0 turns a tone off. The following diagram shows a piano keyboard with the key numbers corresponding to the PILOT sound commands.



Every note in a song is not held for the same length of time. In order to be able to vary the length of time that notes are held, there is a pause command in ATARI PILOT—PA:. The SO: and PA: commands can be used together to make music. The following table shows the PAUSE values for various musical notes.

Pause Values for Musical Notes

PA:16	Sixteenth Note
PA:32	Eighth Note
PA:64	Quarter Note
PA:128	Half Note
PA:256	Whole Note

Each pause is for 1/60 of a second so that PA:2 means to pause for 2/60 of a second and PA:60 means to pause for a second. You can use the pause command in many different kinds of programs to keep something on the screen. It is not limited to music or other sound programs. You can insert it anywhere in a program that you believe is running too fast.

The nursery rhyme "Twinkle, Twinkle, Little Star" is represented in musical notations (with the notes written at the top).

Here are the first few bars translated into ATARI PILOT:

```
10 R:TWINKLE TWINKLE TAKE 1
20 SO:13
30 PA:64
40 SO:0
50 PA:4
60 SO:13
70 PA:64
80 SO:20
90 PA:64
100 SO:0
110 PA:4
120 SO:20
130 PA:64
140 SO:22
150 PA:64
160 SO:0
170 PA:4
180 SO:22
190 PA:64
200 SO:20
210 PA:128
```

Programming this simple melody is tedious. However, it's very easy to begin to add chords, vary what you've done, and get fancy once the basic work is finished. Here's a simple variation on "Twinkle, Twinkle" using chords (see lines 20, 60, 80, 120, 140, 180, and 200).

```
10 R:TWINKLE TWINKLE TAKE 2
20 SO:13,17
30 PA:64
40 SO:0
50 PA:4
60 SO:13,17
70 PA:64
80 SO:20,24
90 PA:64
100 SO:0
110 PA:4
120 SO:20,24
130 PA:64
140 SO:22,25
150 PA:64
160 SO:0
170 PA:4
180 SO:22,25
190 PA:64
200 SO:20,24
210 PA:128
```

Notice that lines 40 and 50, 100 and 110, and 160 and 170 all have the same routine:

```
SO:0
PA:4
```

SO:0 shuts off the sound, and PA:4 makes the program pause for 4/60 or 1/15 of a second. This way you can have a single note sounded several times in a row. Notice that "Twinkle, Twinkle, Little Star" begins CC GG AA.

The SO:0 and PA:4 routine makes it possible to have these notes repeat with a small pause in between them. When a note changes (say, from C to G or G to A), it is not necessary to shut off the sound by using: SO:0.

If you expect to have many repeats in a musical piece that you want to program, the U: can be very convenient. Here's a way to rewrite "Twinkle, Twinkle, Take 1" using a U: command and a module *REPEAT:

```
10 R:TWINKLE TWINKLE TAKE 3
20 SO:13
30 PA:64
40 U:*REPEAT
50 SO:13
60 PA:64
70 SO:20
80 PA:64
90 U:*REPEAT
100 SO:20
110 PA:64
120 SO:22
130 PA:64
140 U:*REPEAT
```

```
150 SO:22
160 PA:64
170 SO:20
180 PA:128
190 *REPEAT
200 SO:0
210 PA:4
220 E:
```

This is another example of the convenience of creating modules and using the U: command.

Here are two more simple music programs using only five notes. Copy them and then change them by varying the pauses, adding chords, or introducing more notes. Feel free to become a composer.

```
10 R:FIVE FINGER EXERCISE#1
20 SO:13
30 PA:32
40 SO:15
50 PA:32
60 SO:17
70 PA:32
80 SO:18
90 PA:32
100 SO:20
110 PA:64

170 PA:32
180 SO:15,18
190 PA:32
200 SO:13,17,20,25
210 PA:128
```

Here are some simple sound effects modules that use ATARI PILOT and can be added to many different types of programs. They use a few commands that will be introduced later. However, they are short enough to copy and use. How they work will become clear after you've gone through the rest of this chapter.

Sound Effects Module 1. This runs from SO:31 to SO:1 in about a second. It sounds a bit like a space gunshot or a jet plane flying past. You can use it in many different ways in the middle of your programs. By putting a PA: statement in at line 135, for example,

```
135 PA:10
```

or

```
135 PA:20
```

you can get a descending scale and a distinctly more musical sound.

```
100 *SOUNDEFFECT1
110 C:#S=31
120 *LOOP
130 SO:#S
140 C:#S=#S-1
150 J(#S>0):*LOOP
160 E:
```

Sound Effects Module 2. This is the ordinary arcade game space shot effect.

```
100 *SOUNDEFFECT2
110 C:#T=6
120 *LOOP1
130 C:#S=31
140 *LOOP2
150 SO:#S
160 C:#S=#S-1
170 J(#S>0):*LOOP2
180 C:#T=#T-1
190 J(#T>0):*LOOP1
200 E:
```

Sound Effects Module 3. This effect is an elaboration of Sound Efects Module 2. It sounds a bit like a staccato laser machine gun or perhaps a space bee.

```
100 *SOUNDEFFECT3
110 C:#T=9
120 *LOOP1
130 C:#S=31
140 *LOOP2
150 SO:#S
160 C:#S=#S-3
170 J(#S>0):*LOOP2
180 C:#T=#T-1
190 J(#T>0):*LOOP1
200 E:
```

Sound Effects Module 4. This is an alien landing effect. It's another of the arcade sounds that are very simple to duplicate with the ATARI Computer and used throughout programs that you create with the U: command.

```
100 *SOUNDEFFECT4
110 C:#T=9
120 *LOOP1
130 C:#S=20
140 *LOOP2
150 SO:#S
160 C:#S=#S+1
170 J(#S<32):*LOOP2
180 C:#T=#T-1
190 J(#T>0):*LOOP1
200 E:
```

Sound Effects Module 5. This effect creates an ascending and descending scale. It can be used at the end of a game or as an introductory remark. If you increase the pauses at lines 140 and 190, say, to PA:10 or PA:20, you will get a much more musical effect.

```
100 *SOUNDEFFECT5
110 C:#S=31
120 *LOOP1
130 SO:#S
140 PA:2
150 C:#S=#S-2
160 J(#S>0):*LOOP1
170 *LOOP2
180 SO:#S
190 PA:2
200 C:#S=#S+2
210 J(#S<32):*LOOP2
```

The sound programs that we've presented are quite simple. Here is a much longer and more complex piece of music that can be programmed using ATARI PILOT. It is the aria "Jesus, Joy of Man's Desiring" from Bach's 57th Cantata. We'll return to it later in this chapter and show how we added color and graphics to accompany the music. It uses simple commands in a complex way and is an example of how interesting music can be programmed in PILOT.

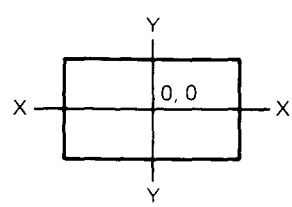
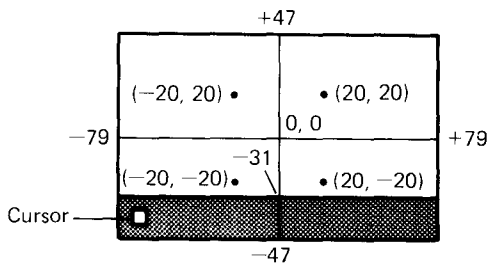
ATARI PILOT Graphics

ATARI PILOT graphics is quite easy to master once you understand the nature of the screen and the characteristics of the turtle. The screen can be thought of as a piece of graph paper 95 columns long and 159 columns wide with two axes crossing each other in the middle.



As in most school arithmetic the middle point is named (0,0) and other points on the grid are presented by the column and row they are in (note that points are always written X,Y

where X stands for the column and Y stands for the row). The X, or column, axis goes from −79 through 0,0 to +79, and the Y axis rows go from −47 to +47. There is a text window on the bottom of the screen in PILOT graphics so that the rows of your drawing board actually end at −31, as in the graph shown here.



We have plotted four points on the screen. Notice how the signs of the X and Y coordinates change according to the position of the point in relationship to the X and Y axes. Imagine where the following points would be on the grid:

20,0	0,20
−20,0	0,−20

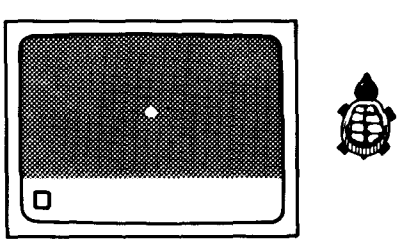
Now comes the first graphics command:

```
GR:
```

Each line in a program that uses graphics *must* begin with GR:. Now turn on the ATARI Computer, type:

```
GR:GOTO 0,0
```

and press the [RETURN] key. You'll notice that the screen looks like this.

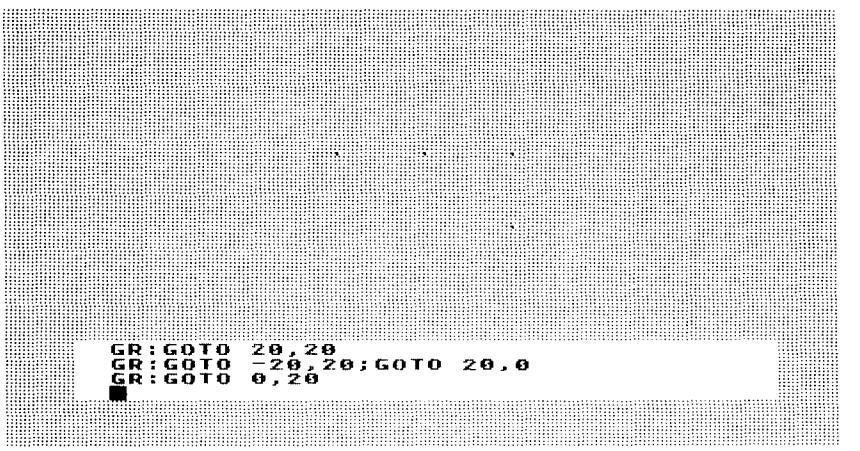


The little white dot at the center is called the "turtle." It does not look as if it is at the center of the screen because the text window with the cursor takes up the equivalent of 16 rows.

The command GOTO: told the turtle to go to point 0,0. Try to move the turtle around before continuing. Here are the points to try: Simply type GR:GOTO X,Y (which will appear in the text window) and press the [RETURN] key.

–20,–20	–20,20	20,–20	20,20
–20,0	0,–20	20,0	0,20

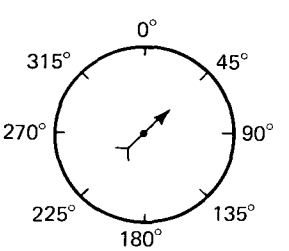
Notice that the turtle will go to the point that you indicate, drop a dot there, and then go on to the next point and drop a dot.



When designing pictures and animations in ATARI PILOT turtle graphics, it is a good idea to keep a pencil and a piece of graph paper next to your computer and do some sketching along with programming.

The turtle itself is like the arrow or spinners used in many board games. It can spin 360° and point in any direction from 0° to 360°. When you begin a program, the turtle is located at point 0,0 and faces toward 0°. The turtle always moves and draws in the direction that it is pointing. As you begin to program in turtle graphics, you must remember

1. What point the turtle is on
2. What direction the turtle is facing.

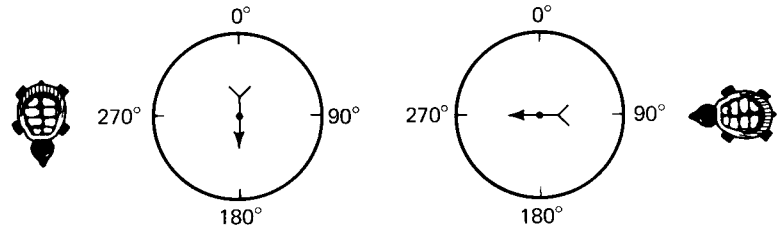


Most commands that the turtle understands come in pairs:

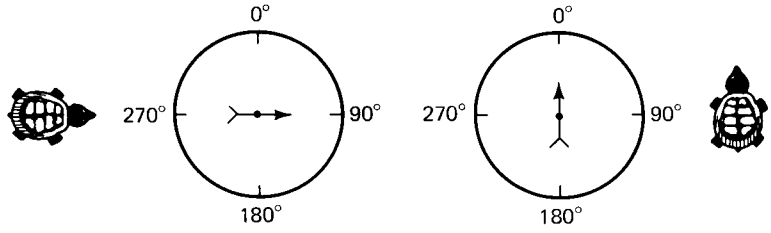
1	GR:DRAW	GR:GO	GR:TURN	GR:FILL
2	GR:DRAWTO	GR:GOTO	GR:TURNTO	GR:FILLTO

The commands on line 1 refer to units on the grid and mean just what they say. GR:DRAW 10 means draw 10 units, which the turtle will do. Remember that the turtle will draw the units in the direction that it is facing.

GR:GO 10 will move the turtle 10 units in that direction. GR:TURN allows you to control the direction of the turtle. GR:TURN 90 instructs the turtle to turn 90°. Thus if the turtle were facing toward 180°, the turtle would turn 90° and end up facing 270°.



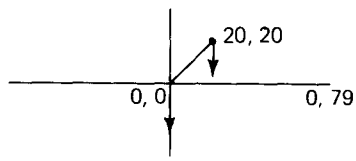
The turtle can also turn counterclockwise by putting a negative sign before the number of degrees that you want it to turn. Thus if the turtle were facing toward 90°, the command GR:TURN –90 would turn it to 0.



Before considering the GR:FILL and GR:FILLTO commands, which are a bit more complex, let's look at the other commands on line 2: GR:DRAWTO, GR:GOTO, and GR:TURNTO. The first two commands refer to points on the grid. Thus

```
GR:DRAWTO  20,20
```

will result in a line from the current location to the point 20,20. Remember that when the turtle is finished drawing, it will be at the end of the line and facing in the same direction as when it began, as illustrated. The turtle begins at 0,0, facing 180, and ends at 20,20, still facing 180.



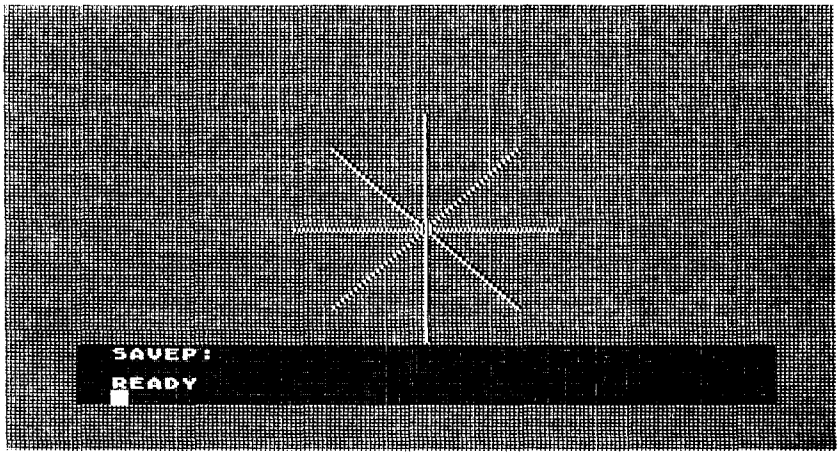
GR:GOTO sends the turtle to a particular point on the grid— thus GR:GOTO 20,20 moves the turtle to 20,20. It ends there but once again facing in the same direction it began.

GR:TURNTO is a second way to control the direction of the turtle. It tells the turtle which angle to face. Thus GR:TURNTO 90 faces the turtle toward 90°, and GR:TURNTO 166 faces the turtle toward 166°.

Here's a simple program using the GR:DRAW, GR:GOTO, and GR:TURNTO commands. Notice that the program uses a shortcut to join several commands. *In ATARI PILOT turtle graphics you can put any number of graphics commands on the same line by separating them with a semicolon (;).*

```
10 GR:DRAW 30;GOTO 0,0;TURNTO 45
20 GR:DRAW 30;GOTO 0,0;TURNTO 90
30 GR:DRAW 30;GOTO 0,0;TURNTO 135
40 GR:DRAW 30;GOTO 0,0;TURNTO 180
50 GR:DRAW 30;GOTO 0,0;TURNTO 225
60 GR:DRAW 30;GOTO 0,0;TURNTO 270
70 GR:DRAW 30;GOTO 0,0;TURNTO 315
80 GR:DRAW 30
```

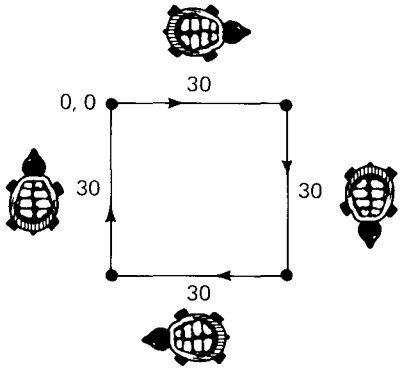
Study the program and try to figure out what it does before studying the screen dump illustration or looking at our explanation. You probably noticed that the only differences between lines 10 to 70 was the angle in the GR:TURNTO command. The turtle starts at 0,0, facing 0°. It draws 30, then returns to 0,0, turns to 45°, and draws 30 again. Then it returns to 0,0 rotates another 45° to 90°, and draws 30. This goes on until the turtle has drawn a line radiating out from 0,0 every 45°, as shown in the following screen dump.



Try to figure out what this program will result in.

```
10 GR:TURN 90;DRAW 30
20 GR:TURN 90;DRAW 30
30 GR:TURN 90;DRAW 30
40 GR:TURN 90;DRAW 30
```

Here's what will happen.

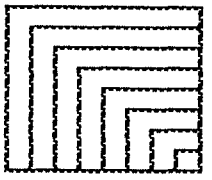


The turtle will draw a square and end back on 0,0 facing 0°, just where it started. Notice that each line in the program is identical; in effect the program says that the turtle should turn 90° and draw 30 units four times. There is a shorthand for continually repeating operations in ATARI PILOT turtle graphics. Lines 10 to 40 can be condensed into one line:

```
10 GR:4(TURN 90;DRAW 30)
```

In general you can enclose in parentheses the commands that you want to be repeated a particular number of times and place the number of repetitions before the left hand parenthesis. The next program, which produces a series of nested boxes, uses this technique a number of times.

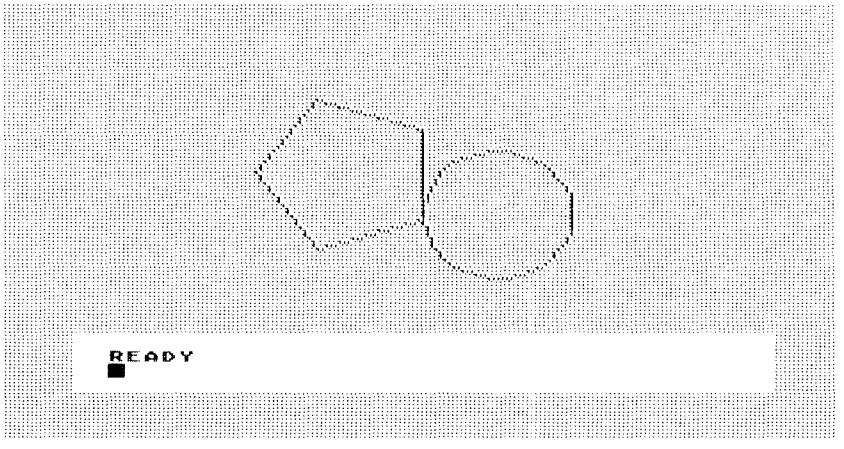
```
100 GR: GOTO 0,20
110 GR:4(TURN 90;DRAW 40)
120 GR:4(TURN 90;DRAW 35)
130 GR:4(TURN 90;DRAW 30)
140 GR:4(TURN 90;DRAW 25)
150 GR:4(TURN 90;DRAW 20)
160 GR:4(TURN 90;DRAW 15)
170 GR:4(TURN 90;DRAW 10)
180 GR:4(TURN 90;DRAW 5)
```



Line 100 jumps the turtle up to row 20, which makes it possible to draw a square with sides 40 units long, as in line 110. If the program didn't begin this way, the 40-unit square would run into the text window at the bottom of the screen.

With the simple concepts presented, it is possible to draw interesting designs and pictures. For example,

```
10 GR:36(DRAW3;TURN10)
20 GR:5(DRAW 25;TURN -72)
```



GR:36(DRAW 5; TURN 10) produces the circle on the right while GR:5 (DRAW 25; TURN –72) produces the pentagon on the left. Notice that 36 × 10 = 360 and 5 × 72 = 360. That means that each program turns 360°, one producing a 36-sided shape approximating a circle, the other a 5-sided shape. A six-sided shape could be drawn using GR:6(DRAW 25; TURN 60).

Try to produce regular polygons with

3 sides

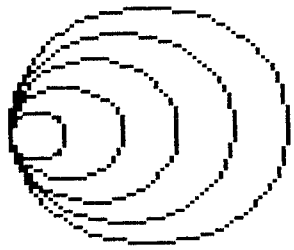
10 sides

12 sides

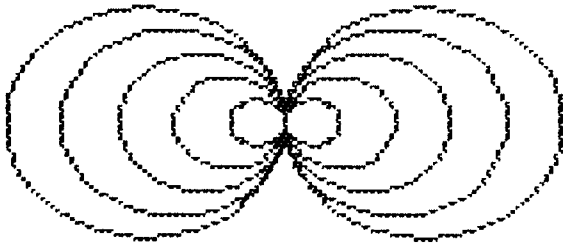
20 sides

Write and run programs that do this. You can also experiment with the length of the line in the DRAW command. For example, here is a series of nested circles created by changing the DRAW statement.

```
10 GR:36(DRAW5;TURN10)
20 GR:36(DRAW4;TURN10)
30 GR:36(DRAW3;TURN10)
40 GR:36(DRAW2;TURN10)
50 GR:36(DRAW1;TURN10)
```



Here is a double design that could be called *pop eyes*.



It was generated by adding the following lines after line 50 in the previous program.

```
60 GR:36(DRAW5;TURN-10)
70 GR:36(DRAW4;TURN-10)
80 GR:36(DRAW3;TURN-10)
90 GR:36(DRAW2;TURN-10)
100 GR:36(DRAW1;TURN-10)
```

Using Color. With the graphics that you have learned it is possible to draw many pictures. Try a face and a man or woman. When drawing the following, GR:PEN commands will be very useful:

GR:PENYELLOW
GR:PENBLUE
GR:PENRED
GR:PENERASE
GR:PENUP

Imagine the turtle carrying three colored pens and an eraser as it moves around the screen. It can use any of the pens (though only one at a time), can erase anything that it

has drawn, and can pick the pen up and move from one part of the screen to another without leaving its usual dot.

When you begin to use the graphics mode, the turtle *always* starts drawing in yellow. To change the color of the pen, you use the command corresponding to the pen color that you want. For example, here's the circle program in three colors.

```
10 GR:36(DRAW5;TURN10)
15 GR:PENRED
20 GR:36(DRAW4;TURN10)
25 GR:PENBLUE
30 GR:36(DRAW3;TURN10)
35 GR:PENYELLOW
40 GR:36(DRAW2;TURN10)
45 GR:PENRED
50 GR:36(DRAW1;TURN10)
55 GR:PENYELLOW
60 GR:36(DRAW5;TURN-10)
65 GR:PENRED
70 GR:36(DRAW4;TURN-10)
75 GR:PENBLUE
80 GR:36(DRAW3;TURN-10)
85 GR:PENYELLOW
90 GR:36(DRAW2;TURN-10)
95 GR:PENRED
100 GR:36(DRAW1;TURN-10)
```

If you like the effect and think that you might want to use it in the future, you can easily turn it into a module and renumber for use in future programs. PILOT has a very useful command that will automatically renumber your programs:

REN

REN renumbers the program statements beginning with the first line of the program. For example, with the circle program, if I type in REN (it does not use a line number), the program comes out:

```
10 GR:36(DRAW5;TURN10)
20 GR:PENRED
30 GR:36(DRAW4;TURN10)
40 GR:PENBLUE
50 GR:36(DRAW3;TURN10)
60 GR:PENYELLOW
70 GR:36(DRAW2;TURN10)
80 GR:PENRED
90 GR:36(DRAW1;TURN10)
100 GR:PENYELLOW
110 GR:36(DRAW5;TURN-10)
120 GR:PENRED
130 GR:36(DRAW4;TURN-10)
140 GR:PENBLUE
```

```
150 GR:36(DRAW3;TURN-10)
160 GR:PENYELLOW
170 GR:36(DRAW2;TURN-10)
180 GR:PENRED
190 GR:36(DRAW1;TURN-10)
```

REN will also let you begin renumbering at any line number and increase each statement by any amount that you want. For example, REN 60,5 will renumber all statements starting with 60 and increase each line number by 5's.

The way to turn a short program into a module, as you may remember, is first by naming it and then by putting an E: statement at the end of it. Thus we could call the preceding program *CIRCLES. When saving modules for use in other programs, it is helpful to give them high line numbers so that you can tag them on to programs. Here's *CIRCLES, starting at line 600:

```
600 *CIRCLES
610 GR:36(DRAW5;TURN10)
620 GR:PENRED
630 GR:36(DRAW4;TURN10)
640 GR:PENBLUE
650 GR:36(DRAW3;TURN10)
660 GR:PENYELLOW
670 GR:36(DRAW2;TURN10)
680 GR:PENRED
690 GR:36(DRAW1;TURN10)
700 GR:PENYELLOW
710 GR:36(DRAW5;TURN-10)
720 GR:PENRED
730 GR:36(DRAW4;TURN-10)
740 GR:PENBLUE
750 GR:36(DRAW3;TURN-10)
760 GR:PENYELLOW
770 GR:36(DRAW2;TURN-10)
780 GR:PENRED
790 GR:36(DRAW1;TURN-10)
800 E:
```

Here's a simple program that uses *CIRCLES. It asks if someone wants to see circles and uses the module if he or she does. If not, then it types:

SORRY MAYBE SOME OTHER TIME.

Notice that the first lines are all that had to be added. The module wasn't changed in any way.

```
10 T:DO YOU WANT TO SEE CIRCLES?
20 A:
30 M:YES
40 JY:*CIRCLES
50 M:NO
```

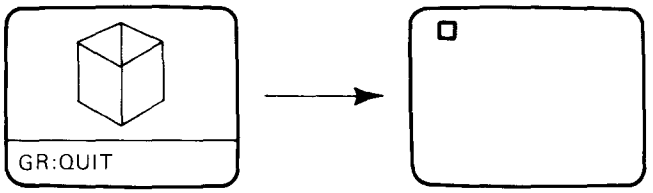
```
60 TY:SORRY MAYBE SOME OTHER TIME
70 E:
600 *CIRCLES
610 GR:36(DRAW5;TURN10)
620 GR:PENRED
630 GR:36(DRAW4;TURN10)
640 GR:PENBLUE
650 GR:36(DRAW3;TURN10)
660 GR:PENYELLOW
670 GR:36(DRAW2;TURN10)
680 GR:PENRED
690 GR:36(DRAW1;TURN10)
700 GR:PENYELLOW
710 GR:36(DRAW5;TURN-10)
720 GR:PENRED
730 GR:36(DRAW4;TURN-10)
740 GR:PENBLUE
750 GR:36(DRAW3;TURN-10)
760 GR:PENYELLOW
770 GR:36(DRAW2;TURN-10)
780 GR:PENRED
790 GR:36(DRAW1;TURN-10)
800 E:
```

The GR:PENERASE command lets you erase what you have drawn. The following simple program repeatedly draws and erases a circle. The GR:PENERASE command can be used to make part of a drawing appear and disappear and, in more complex sketching programs such as the Rambrant program at the end of this chapter, allows you to create and correct your own drawings.

```
10 *CIRCLENOCIRCLE
20 GR:36(DRAW5;TURN10)
30 GR:PENERASE
40 GR:36(DRAW5;TURN10)
50 GR:PENYELLOW
60 J:*CIRCLENOCIRCLE
```

The PEN UP command tells the turtle to pick the pen off the screen. While the pen is up, all movement by the turtle will be invisible. To put the pen "down," you choose a pen color.

When developing your own graphics programs two other commands are very useful: GR:QUIT and GR:CLEAR. GR:QUIT allows you to leave the graphics mode and returns you to the full-screen print mode. It is particularly useful if you need to see a whole program listing to make additions or corrections after playing with graphics. In that case you just type GR:QUIT, which will appear in the print window at the bottom of the graphics screen. No line number should be used. When you press [RETURN], the screen will return to the print mode.

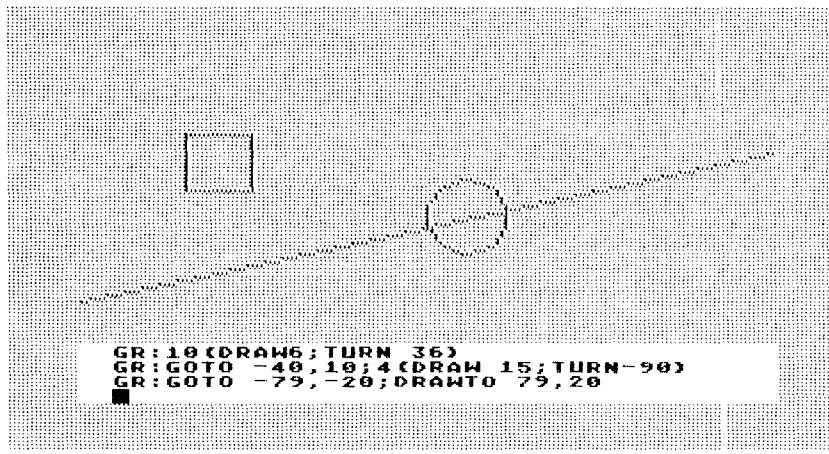


GR:QUIT can also be used to get out of the graphics mode in the middle of a program. For example, this program draws a red circle and then asks if you like it. If you say yes, it draws a blue circle. If no, it ends. At line 120 the screen goes from graphics to print mode.

```
10 U:*REDCIRCLE
20 T:DID YOU LIKE IT?
30 A:
40 M:YES
50 TY:WELL HERE IS ANOTHER ONE
60 J:*BLUECIRCLE
70 M:NO
80 TY:SORRY
90 E:
100 *REDCIRCLE
110 GR:PENRED;36(DRAW 5;TURN 10)
120 GR:QUIT
130 E:
140 *BLUECIRCLE
150 GR:PENBLUE;36(DRAW 5;TURN 10)
160 E:
```

GR:CLEAR does the opposite of GR:QUIT, which returns you from the graphics screen to the print screen. If you type GR:CLEAR and press [RETURN], the graphics screen will appear with the text window beneath it. The turtle will have disappeared from the center of the screen as well (everything was cleared from the screen). You can now use all the graphics commands to sketch and draw. As long as you don't use line numbers, you will see what you've drawn as soon as you press [RETURN]. Notice in the following sketch that you can see at most four print lines at a time in the window. If you like something that you've drawn, you can insert a line number at the beginning of any line and it will become a part of your program. If you want a clear screen to sketch with, all you must do is type GR:CLEAR.

(Note: The four-line limit is why GR:QUIT is needed. You simply can't see a long program and watch it run at the same time.)



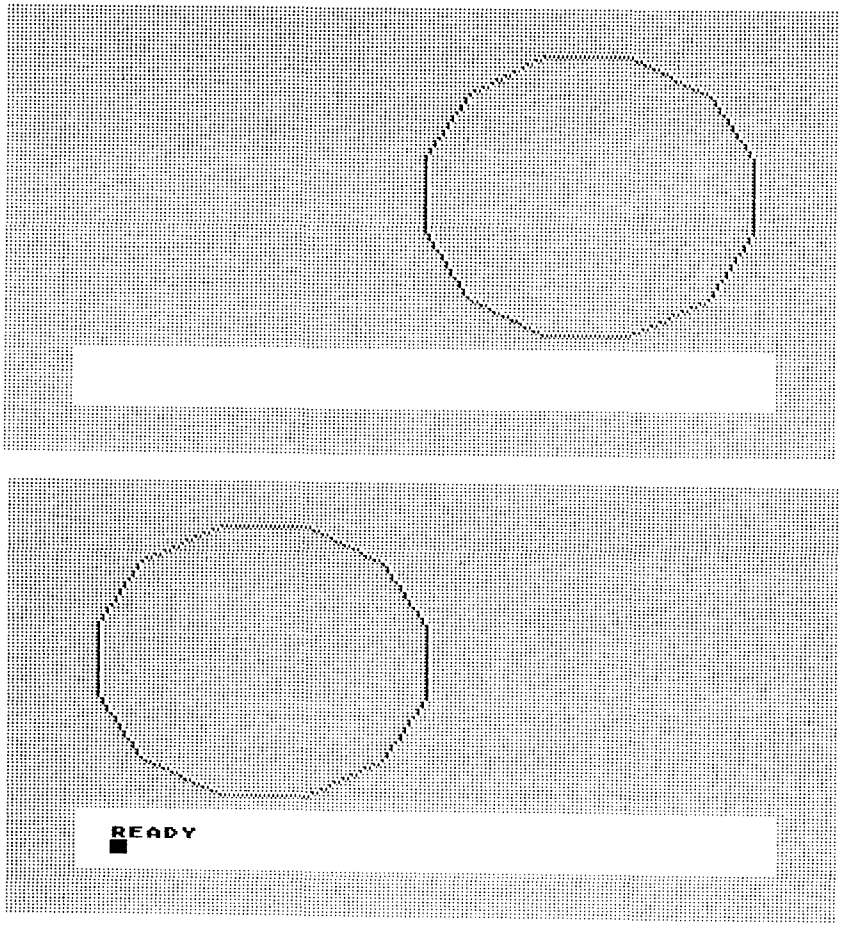
GR:CLEAR can also be used inside a program to clear the screen and then see another image. *Most graphic programs begin with GR:CLEAR, as it eliminates the dot at 0,0, where the turtle starts.* GR:CLEAR is also the secret of simple animation. You draw a figure at one spot, clear the screen, then move it to another spot, and on and on with GR:CLEAR statements. You can even control the speed of movement by using the pause PA: command described in the sound section. This simple program moves a 12-sided regular polygon from the right of the screen to the left of the screen. If you turned into a module that jumped back to itself, you would have continual movement back and forth as in Program 2.

Program 1

```
10 GR:12(DRAW 20;TURN 30)
20 PA:50
30 GR:CLEAR
40 GR:12(DRAW 20;TURN-30)
```

Program 2

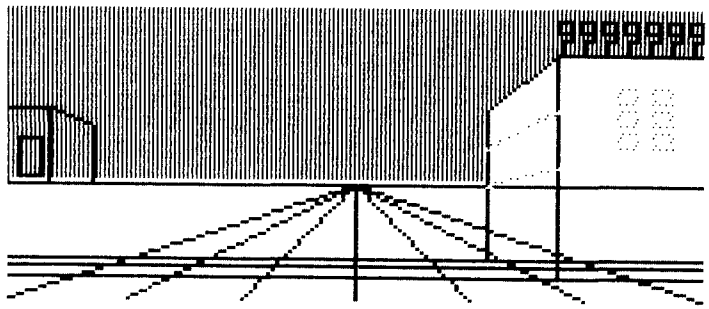
```
5 *CIRCLESWITCH
10 GR:12(DRAW 20;TURN 30)
20 PA:50
30 GR:CLEAR
40 GR:12(DRAW 20;TURN-30)
45 GR:CLEAR
50 J:*CIRCLESWITCH
```



Animation. This simple animation program moves a circle across the screen. Add some eyes, a mouth, and some color; you'll have your first animation. Read the program first and imagine what it does. By now it shouldn't be too hard.

```
5 GR:CLEAR
10 GR:GOTO -80,0:36(DRAW 3:TURN 10)
20 PA:10
30 GR:CLEAR
40 GR:GOTO -60,0:36(DRAW 3:TURN 10)
50 PA:10
60 GR:CLEAR
70 GR:GOTO -40,0:36(DRAW 3:TURN 10)
80 PA:10
90 GR:CLEAR
100 GR:GOTO -20,0:36(DRAW 3:TURN 10)
110 PA:10
120 GR:CLEAR
130 GR:GOTO -10,0:36(DRAW 3:TURN 10)
140 PA:10
150 GR:CLEAR
160 GR:GOTO 0,0:36(DRAW 3:TURN 10)
```

This picture resulted from sketching and saving parts of sketches by turning them into modules.



```

Before proceeding to the last two graphic commands—GR:FILL and GR:FILLTO—here's a summary of the commands covered so far. Review them if you have forgotten them.

GR:GO	GR:DRAW	GR:TURN	1
GR:GOTO	GR:DRAWTO	GR:TURNTO	

GR:PEN		
GR:PENRED	GR:PENERASE	2
GR:PENBLUE	GR:PENUP	
GR:PENYELLOW		

GR:CLEAR	REN (renumber)	3
GR:QUIT		

Notice that PILOT turtle graphics commands do what they say. PILOT is designed to be a friendly language. If you forget a command, think of what you want to do and there's a good chance that the right command will pop out of your memory.

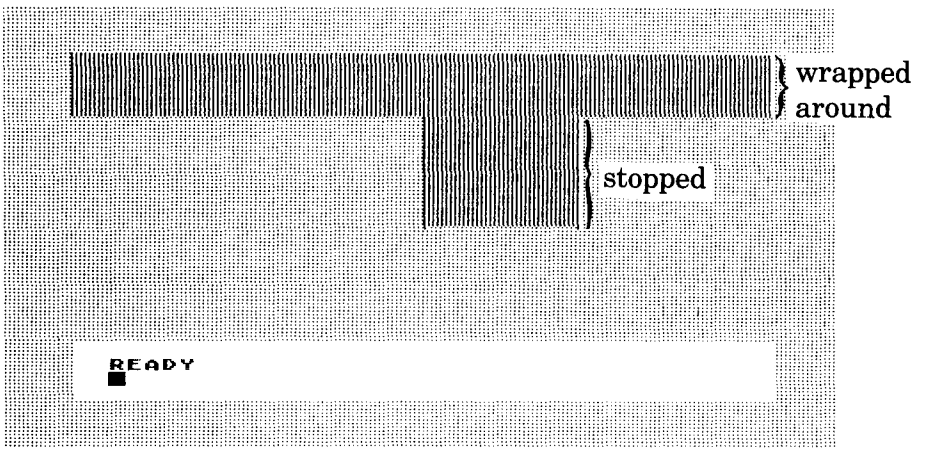
Finally, GR:FILL and GR:FILLTO also do just what they say: fill in sections of the screen with different colors and make it possible for you to color in your drawings. GR:FILL is like the GR:DRAW statement. It tells the turtle to draw a line *N* units long in the direction that it is facing. As the turtle moves, however, all the background screen space to the *right* of the turtle will be filled in with the current pen color. The fill will stop wherever there is a line. If there is no line, the turtle will wrap around the screen and return on the other side to make a stripe of color. To see that, try this extremely simple program:

```
10 GR:CLEAR;FILL 20
```

You get a yellow band across the screen. If you put a line to the right of the fill statement, the filling would stop wherever the line was, as in this program:

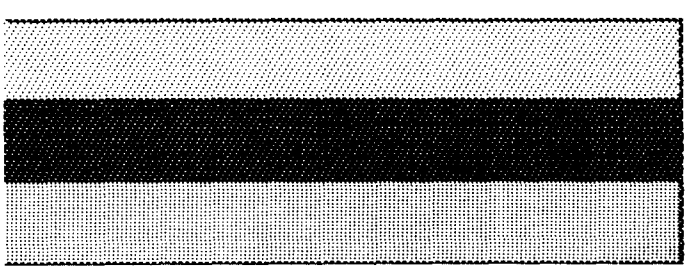
```
10 GR:CLEAR;GOTO 35,0;DRAW 30
20 GR:GOTO 0,0;FILL 50
```

This is the shape generated by the program (on your screen it would be yellow). Notice that the fill stopped where the line was drawn. However, as it went past that line up the screen, it went off the screen at the right and then wrapped around to the left, making a solid stripe.



A good way to get a sense of the use of GR:FILL is to make flags of different colors, designs, and stripes. Here's a simple three-color flag. First the border is drawn from top left around the edges and then the stripes are fitted from the left-hand side to the right border.

```
110 GR:CLEAR
120 GR:GOTO -77,39:TURNTO 90:DRAW 154
130 GR:TURN 90:DRAW 67:TURN 90:DRAW 154
140 GR:PEN RED:TURN 90:FILL 22
150 GR:PEN YELLOW:FILL 23:PEN BLUE:FILL 22
```



Here are three more simple flag progams. Try to match them with the following flags before running them. Then make your own flags. Draw diagonal lines. Try to fill in a square, a circle, a window in a house that you draw. Practice with GR:FILL is important.

1

```
100 R:FLAGS SIMPLE FORM #2
110 GR:CLEAR
120 GR:GOTO -20,5;36(DRAW 2;TURN 10)
130 GR:GOTO -77,39;TURNTO 90;DRAW 154
140 GR:TURN 90;DRAW 67;TURN 90;DRAW 15
4
150 GR:PEN RED;TURN 90;FILL 22
160 GR:PEN BLUE;DRAW 23;PEN RED;FILL 2
2
```

2

```
100 GR:CLEAR
110 GR:GOTO -78,46;TURNTO 90
120 GR:2(DRAW 156;TURN 90;DRAW 76;TURN
 90)

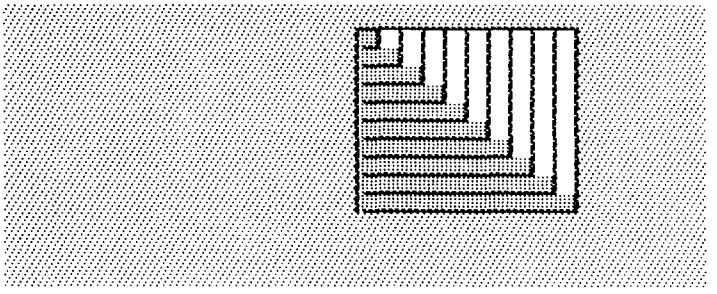
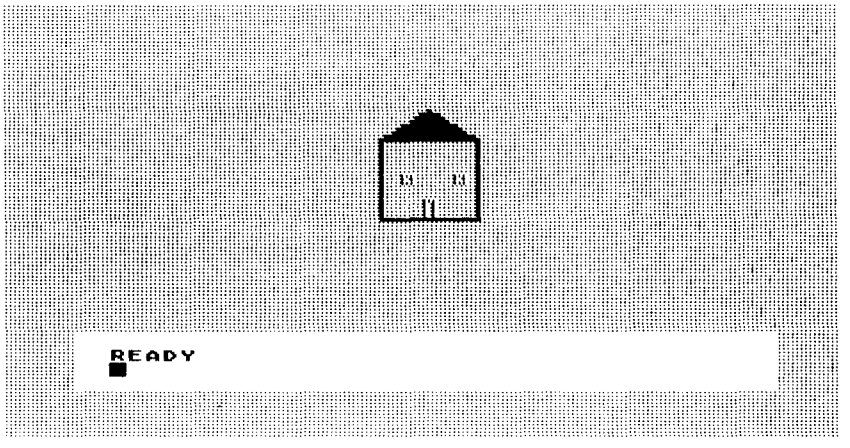
ILL 78
230 GR:GOTO 51,41;TURNTO 180;FILL 55
```

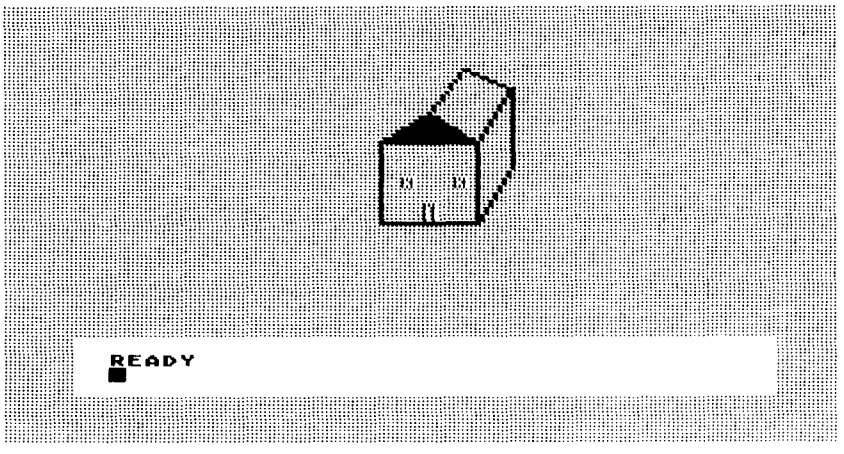


GR:FILLTO X,Y functions just like GR:FILL except that it draws a line to the point X,Y and fills in anything to the right of the line with the current pen color until it is blocked by another line. Here's a simple house module that you may want to use in some programs. Notice that the roof is made red by using a GR:FILLTO statement (line 550).



```
500 *HOUSE
510 GR:2(DRAW 5;TURN 90;DRAW 2;TURN 90)
520 GR:GOTO -5,10;TURNTO 0;4(DRAW 2;TURN 90)
530 GR:GOTO 7,10;TURNTO 0;4(DRAW 2;TURN90)
540 GR:PEN RED;GOTO -10,0;TURNTO 0;4(DRAW 22;TURN 90)
550 GR:GOTO 12,22;DRAWTO 1,30;FILLTO -10,22
560 E:
```

Here's another house module that uses GR:FILLTO. Remember that you can change these modules, place them on the screen anywhere you want, color them in differently, and change their size. All this can be done with the commands and concepts presented in this book.



```
700 *3DHOUSE
710 GR:2(DRAW 5;TURN 90;DRAW 2;TURN 90)
720 GR:GOTO -5,10;TURNTO 0;4(DRAW 2;TURN 90)
730 GR:GOTO 7,10;TURNTO 0;4(DRAW 2;TURN90)
740 GR:PEN RED;GOTO -10,0;TURNTO 0;4(DRAW 22;TURN 90)
750 GR:GOTO 12,22;DRAWTO 1,30;FILLTO -10,22
760 GR:GOTO 12,0;DRAWTO 20,15;DRAWTO 20,37
770 GR:GOTO 12,22;DRAWTO 20,37
780 GR:GOTO 1,30;DRAWTO 9,42;DRAWTO 20,37
790 E:
```

This much more complex animation program uses this house module. Unless you are an experienced programmer, you will not understand it. However, you can look for the modules and the U: and J: statements and piece quite a bit of it together. It uses the C: command, which we will introduce shortly, and the C: @ B#X command, which is the command for poking directly into a memory location in ATARI PILOT. B#X means "at byte number X." Poking is a powerful device as it allows you to change things directly in the computer's

chip. Appendix II provides an explanation of this concept and gives POKE numbers that allow you to do powerful things in ATARI PILOT. We recommend that you look at it and at the ATARI PILOT reference manual, which also contains POKE numbers. If you don't understand it at first reading, don't worry. You'll see its value as you practice programming. Refer to it several times and experiment with it.

This program, created by Andy Hall, a sophomore at Cal Tech, is a short animation about Sir Isaac Newton. It is the first of many longer programs in this book. You may want to copy it now. If not, look through it and return to it when you have time. The virtue of copying programs is that it gives you a feel for the way that experienced programmers work as well as access to a lot of software, which once copied can be stored on tape or cassette and used repeatedly.

Computing in ATARI PILOT—The C: Command

As you've seen, all graphics statements in ATARI PILOT turtle graphics must begin with the GR: command. In the same way all statements in ATARI PILOT concerning the manipulation of numbers must begin with the compute command C:.

In addition the only numbers that ATARI PILOT recognizes are the positive and negative integers:

0, 1, 2, 3, 4, 5 . . .

–1, –2, –3, –4, –5. . . .

You will see in the chapter on math and logic games that this is not as much of a limitation as you might think. Addition, subtraction, and multiplication are performed in the usual way. However, division always results in giving the integer answer and dropping the remainder unless you use the modular arithmetic, the explanation of which is beyond the scope of this book. Thus

2 + 3 = 5

3 – 2 = 1

2 * 3 = 6

but

5/2 will result in 2 (remainder 1 dropped)
5/3 will result in 1 (remainder 2 dropped)

In all of the drill-and-practice programs in the math and

logic chapter of the book, we've used modular arithmetic so that division can be done as usual.

C: works with number variables, which are designated by # and a variable name, for example, #X, #Y, or #A. It takes the form

C:#X=#Y+ 10 (i)

or

C:#X=#Y− 5 (ii)

or

C:#X=#Y+#Z (iii)

or

C:#X=#X+1 (iv)

Thus, (i) adds 10 to any #Y, (ii) subtracts 5, and (iii) adds two numbers, #Y and #Z. In many programs (iv) is particularly important. It is usually used within a module and says that each time it's used the original value of #X should be increased by 1.

This simple program multiplies a number that you input by 10:

```
10 T:GIVE ME A NUMBER AND I'LL
20 T:MULTIPLY IT BY 10
30 A:#X
40 C:#Y=#X*10
50 T:#Y
```

This example uses C:#X=#X+1:

```
10 C:#X=1
20 *GROWTH
30 C:#X=#X+1
35 T:#X
40 J:*GROWTH
```

If you run it, the computer will display a list of numbers beginning with 2 and increasing by 1 (2, 3, 4, 5, 6, . . .) until you press the [BREAK] key. The computer sets up an infinite loop, which is not useful in the middle of a program as it will never stop. However, there is a simple way to determine a specific number of loops in ATARI PILOT. PILOT commands can be used in conjunction with these signs:

< less than

<= less than or equal to

= equal to

> greater than

>= greater than or equal to

to determine conditions under which certain operations are performed. The chart illustrates these commands:

C:	C(#X<#Y):	C(#X<=#Y):	C(#X=#Y):	C(#X>#Y):	C(#X>=#Y)
J:	J(#X<#Y):	J(#X<=#Y):	J(#X=#Y):	J(#X>#Y):	J(#X>=#Y)
U:	U(#X<#Y):	U(#X<=#Y):	U(#X=#Y):	U(#X>#Y):	U(#X>=#Y)
T:	T(#X<#Y):	T(#X<=#Y):	T(#X=#Y):	T(#X>#Y):	T(#X>=#Y)
M:	M(#X<#Y):	M(#X<=#Y):	M(#X=#Y):	M(#X>#Y):	M(#X>=#Y)
GR:	GR(#X<#Y):	GR(#X<=#Y):	GR(#X=#Y):	GR(#X>#Y):	GR(#X>=#Y)
SO:	SO(#X<#Y):	SO(#X<=#Y):	SO(#X=#Y):	SO(#X>#Y):	SO(#X>=#Y)
PA:	PA(#X<#Y):	PA(#X<=#Y):	PA(#X=#Y):	PA(#X>#Y):	PA(#X>=#Y)

This program illustrates the use of the J(#X<#Y): command:

```
10 C:#X=1
20 *GROWTH
30 C:#X=#X+1
35 T:#X
40 J(#X<20):*GROWTH
```

Line 40 says that if #X is less than 20, then the program should jump to *GROWTH. When #X gets bigger than 20, the program will stop. This program, instead of printing an infinite list, prints 2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20 . . . . . Note that in order for the program to work, *#X must have an initial value,* which is what line 10 does. If line 10 read

```
10 C:#X=15,
```

the program would print

```
16,17,18,19,20
```

Try the following modifications of the program.

- Make it print out 14,15,16,17,18.
- Make it print out 1,2,3,4,5,6,7.

- Make it print all even numbers up to 20.
- Make it print all odd numbers up to 20.

Here's an example of how numerical conditions can determine graphics. The two modules, *HOUSE and *3DHOUSE, were already presented. Here they are combined in a program. If you type in a number less than 10, you will see *HOUSE. If you type in 10 or a larger number, you will see *3DHOUSE.

```
10 T:GIVE ME A NUMBER
20 A:#X
30 J(#X<10):*HOUSE
40 J(#X>=10):*3DHOUSE
50 E:
500 *3DHOUSE
510 GR:2(DRAW 5;TURN 90;DRAW 2;TURN 90)
520 GR:GOTO -5,10;TURNTO 0;4(DRAW 2;TURN 90)
530 GR:GOTO 7,10;TURNTO 0;4(DRAW 2;TURN90)

570 GR:GOTO 12,22;DRAWTO 20,37
580 GR:GOTO 1,30;DRAWTO 9,42;DRAWTO 20,37
590 E:
600 *HOUSE
610 GR:2(DRAW 5;TURN 90;DRAW 2;TURN 90)
620 GR:GOTO -5,10;TURNTO 0;4(DRAW 2;TURN 90)
630 GR:GOTO 7,10;TURNTO 0;4(DRAW 2;TURN90)
640 GR:PEN RED;GOTO -10,0;TURNTO 0;4(DRAW 22;TURN 90)
650 GR:GOTO 12,22;DRAWTO 1,30;FILLTO -10,22
```

Another feature of C: is that it allows you to select random numbers, that is, numbers chosen by chance. This can be a powerful programming tool since it allows you to simulate coin tossing or dice throwing and to create programs that change each time they are run. A random number #X is chosen when you type in the following command:

C:#X=?

the ? is the ATARI PILOT symbol for random number. In this program the computer selects a random number. If it is less than or equal to 50, you get *HOUSE; if it is less than 50, you get *3DHOUSE.

```
10 R:RANDOM NUMBER GUESS
20 C:#X=?
30 J(#X<=50):*HOUSE
40 J(#X>50):*3DHOUSE
50 E:
500 *3DHOUSE
510 GR:2(DRAW 5;TURN 90;DRAW 2;TURN 90)
520 GR:GOTO -5,10;TURNTO 0;4(DRAW 2;TURN 90)
```

```
530 GR:GOTO 7,10;TURNTO 0;4(DRAW 2;TURN90)
540 GR:PEN RED;GOTO -10,0;TURNTO 0;4(DRAW 22;TURN 90)
550 GR:GOTO 12,22;DRAWTO 1,30;FILLTO -10,22
560 GR:GOTO 12,0;DRAWTO 20,15;DRAWTO 20,37
570 GR:GOTO 12,22;DRAWTO 20,37
580 GR:GOTO 1,30;DRAWTO 9,42;DRAWTO 20,37

600 *HOUSE
610 GR:2(DRAW 5;TURN 90;DRAW 2;TURN 90)
620 GR:GOTO -5,10;TURNTO 0;4(DRAW 2;TURN 90)
630 GR:GOTO 7,10;TURNTO 0;4(DRAW 2;TURN90)
640 GR:PEN RED;GOTO -10,0;TURNTO 0;4(DRAW 22;TURN 90)
650 GR:GOTO 12,22;DRAWTO 1,30;FILLTO -10,22
660 E:
```

If you want to choose a random number from a limited set of numbers (for example, 1 from 6 as in dice or 1 from 2 as in coin tossing), the command is

C:#X=?\N

Notice that \ is the opposite of / the symbol for division. It is located on the + key. [SHIFT][+] gives you \.

N stands for the upper limit for selecting a random number. ?\2 selects from 0 and 1; ?\6 selects from 0,1,2,3,4,5.

Remember that the upper limit itself is not included in the set of numbers chosen from. This program randomly draws a circle or square using: C:#X=?\2 at line 10.

```
10 C:#X=?\2
20 J(#X=0):*CIRCLE
30 J(#X=1):*SQUARE
40 E:
50 *CIRCLE
60 GR:36(DRAW 5;TURN 10)
70 E:
80 *SQUARE
90 GR:4(DRAW 25;TURN 90)
100 E:
```

Programs and Patterns. Here are a number of programs that generate beautiful patterns using C: and the other ATARI PILOT commands.

POKES and Graphics. Here are a number of other short programs that produce beautiful visual effects. They use POKE numbers (see Appendix II for an explanation). You can copy and use them even if you don't care to examine the POKES that they use.

The first is a more complex flower petal arrangement; the second a series of fans that you can generate, the third a sphere, and the fourth, and perhaps most impressive, a color display of continually changing patterns created by rotating lines through different angles.

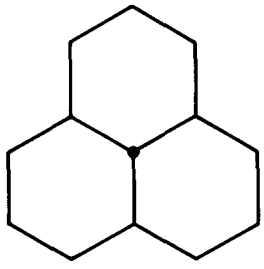
Tessellations

Anyone who has seen a tiled bathroom or a floor covered with linoleum pentagons or octagons should have no trouble understanding a tessellation. Tessellations are made by piecing together repetitions of the same shape so that they would cover an infinite plane. The most common tile is six-sided.



The illustration shows three tiles fitted together. You could cover the plane by adding more and more identical tiles indefinitely. Of course, bathrooms and kitchens are not infinite in size; some tiles must be cut at the edges. But a tessellation as an idea goes on forever. The Dutch artist M. C. Escher used tessellations in some of his most intriguing and interesting paintings.

ATARI PILOT turtle graphics makes it possible for you to create all kinds of interesting tessellations. We'll start simply and end with a complex program that combines sound, color, and tessellations.

The first step toward creating tessellations is to figure out how to repeat a form across the screen. With a combination of the C: command and graphics commands, this can be done simply, as in this program which produces the following pattern across the screen.

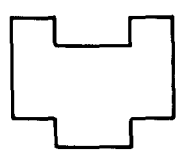
```
10 C:#X=-79
20 C:#Y=0
30 *PLOT
40 GR:GOTO #X,#Y:TURNTO 90:DRAW 5
50 C:#X=#X+20
55 C:#Y=0
60 J(#X<80):*PLOT
```

Note that lines 10 and 20 set the X and Y coordinates at −79 and 0, respectively. The module *PLOT essentially instructs the turtle to go to −79,0, turn to 90°, and draw a line 5 units long. Then it adds 20 to the X coordinate, keeps Y the same, and jumps back to plotting the new #X,#Y (the first time around the loop it will plot −59,0, the second time −39,0, etc.) When #X is larger than 80 (and therefore goes off the screen), the program stops.

To make the program a bit more complex, the DRAW command on line 40 can be replaced by commands that result in a square, as in the following program:

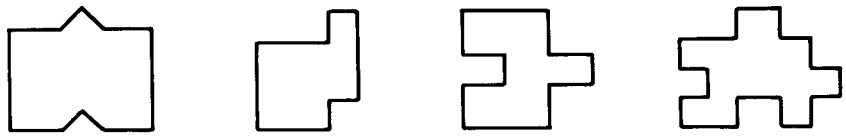
```
10 C:#X=-79
20 C:#Y=0
30 *PLOT
40 GR:GOTO #X,#Y;TURNTO 90;4(DRAW 20;TURN 90)
50 C:#X=#X+20
55 C:#Y=0
60 J(#X<80):*PLOT
```

This is beginning to look more like a tessellation. If the squares could begin at the bottom left or top left of the screen and cover the whole screen, we'd have a simple tessellation. That can be done by changing the value of #Y each time that a line is completed so that the program changes rows as well as columns. Instead of demonstrating this with a square, we'll use a more interesting form.



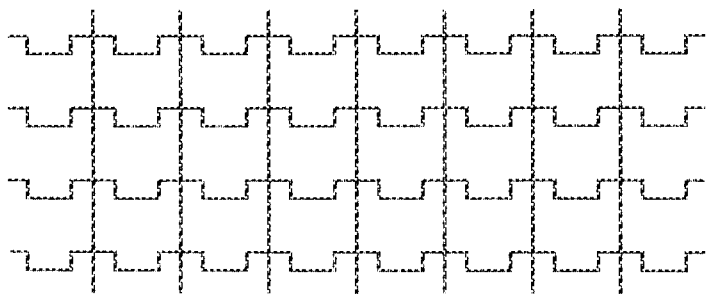
```
5 R:TESSMOD#1
10 GR:2(TURN 90;DRAW 5);TURN-90;DRAW 10
20 GR:TURN -90;DRAW 5;TURN 90;DRAW 5
30 GR:TURN -90;DRAW 20;TURN -90;DRAW 5
40 GR:TURN -90;DRAW 5;TURN 90;DRAW 10
50 GR:TURN 90;DRAW 5;TURN -90;DRAW 5
60 GR:TURN -90;DRAW 20
```

This form was created by taking away a piece of the top of the square and adding it to the bottom. Regular additions and subtractions within a regular form retain the ability to tessellate the plane and provide you with an infinite variety of potential tessellations.



This tessellation program uses the first tessmodule.

```
100 R:TESS #1
110 C:#X=-80
120 C:#Y=-40
130 GR:CLEAR:TURNTO 0
140 *LOOP
150 U:*TESS
160 C:#Y=#Y+20
170 J(#Y<41):*LOOP
180 C:#X=#X+20
190 C:#Y=-40
200 J(#X<61):*LOOP
210 E:
220 *TESS
230 GR:GOTO #X,#Y:TURNTO 0
240 GR:2(TURN90:DRAW5):TURN-90:DRAW10
250 GR:TURN -90:DRAW 5:TURN 90:DRAW 5
260 GR:TURN -90:DRAW 20:TURN -90:DRAW 5
270 GR:TURN -90:DRAW 5:TURN 90:DRAW 10
280 GR:TURN 90:DRAW 5:TURN -90:DRAW 5
290 GR:TURN -90:DRAW 20
300 E:
```



Notice that there are two modules in the program: *LOOP and *TESS. *LOOP controls the position of the turtle and *TESS draws the tessellating form. It is worth studying how #X and #Y change in this program. Remember that we are

still using the 20 × 20 basic square that we used to draw squares across the screen. That's why 20 appears in lines 160 and 180. The program begins at −80, −40 at the bottom left of the screen and moves across the screen to the right. Line 170 jumps the program 20 rows higher just before #X is to go off the screen. This may seem a bit tricky, but if you copy the program and use your own *TESS Modules, you should catch on quickly. We could have chosen to draw a form every 10 or 25 units (in lines 160 or 180) if we wanted. The former would have made the tessellation units smaller, the latter larger. Play with all these variables and see what you come up with.

With a little fiddling around and dressing up you can begin to approximate animal or people forms for your tessellations. Here are two stages of an elephant/horse/camel(?) that we developed.

```

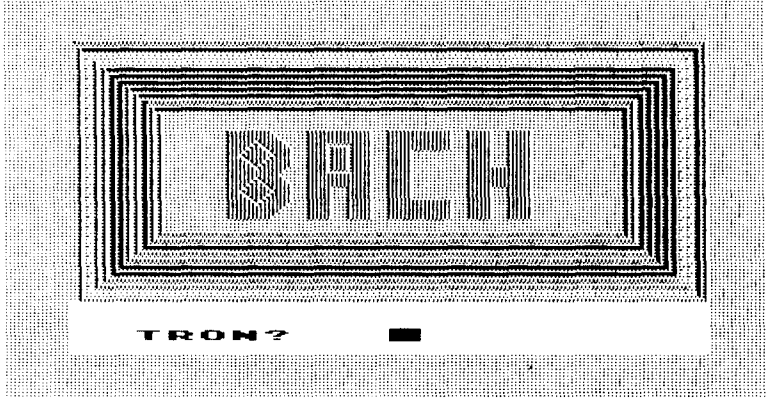
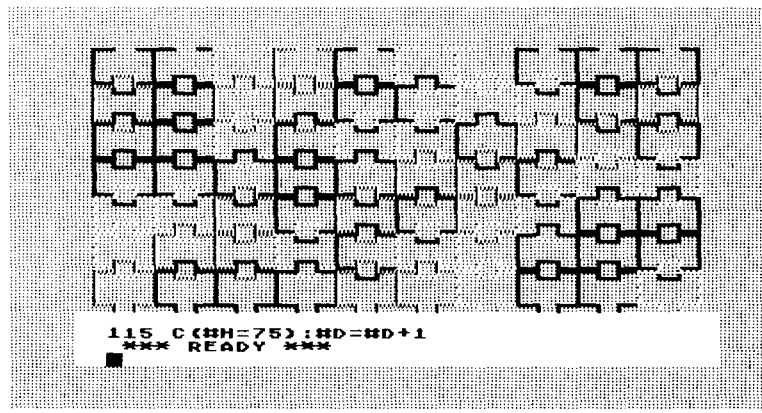
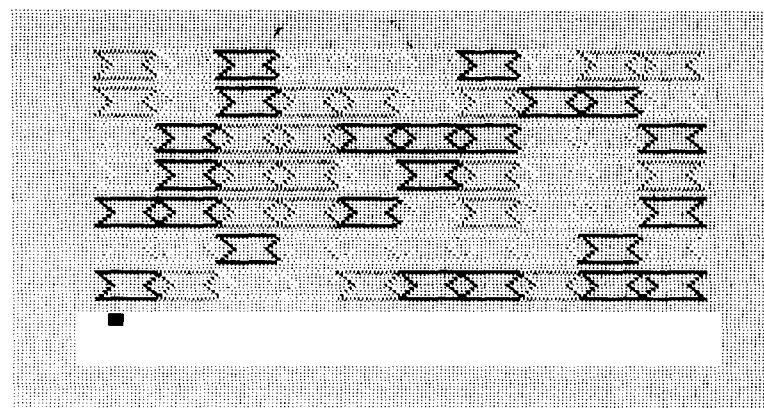
Bach

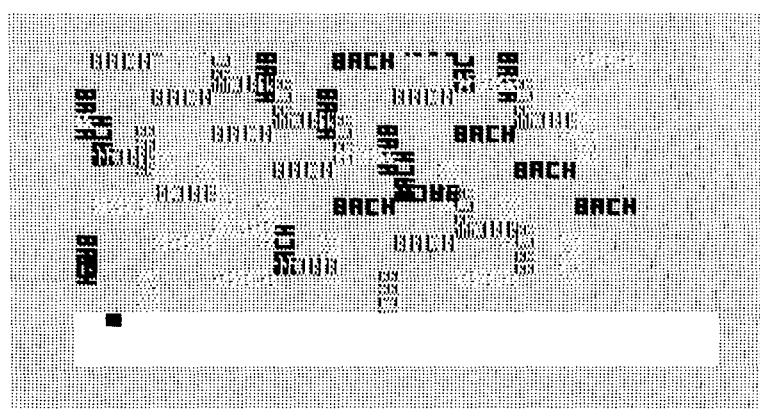
Finally here is a program that we have called Bach, that orchestrates the music from Bach's 57th Cantata (which is reproduced in the sound section) with a variety of tessellations and color changes. The program displays the range of hues and luminescences that enrich the color possibilities of the ATARI Computer. (Control of these hues and luminescences can be done in PILOT using the POKE numbers listed in Appendix II.) The program also has a TRON (trace on) function, that is, a function that tells where it is in the music and what color it is using while it's running.



Bach is a tribute to Richard Hofstadter, whose book *Gödel, Escher, Bach: An Eternal Golden Braid* (Basic Books, 1979) weaves together music, painting, and self-reference to make a wonderful combination of opera buffa and opera seriosa.







```

Rambrant

Rambrant is a program that allows you to draw on the screen using a joystick. You can make figures and shapes; can change colors, hues, and luminances; draw with cubes or stars; and do quad drawing (that is, drawing with four paints simultaneously) that produces designs like the illustrations.

Here is the menu for the program.

```
      *** RAMBRANDT COMMANDS ***

MOVE JOYSTICK TO DRAW
PRESS TRIGGER TO CHANGE PENS

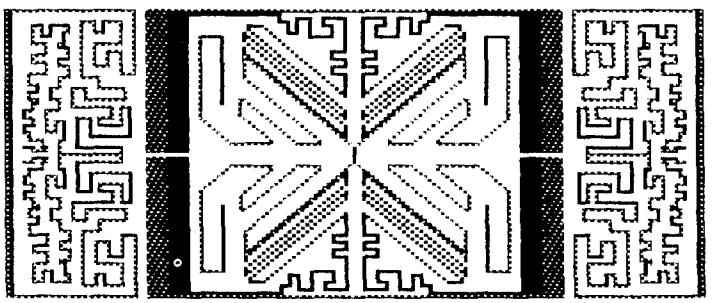
KEYBOARD OPTIONS:

B: Change Background Color
C: 3-D CUBE (hold key down & draw)
D: Disk Storage (Save & Load Screen)
E: Erase Screen
H: Change HUE of current pen
L: Change LUMINANCE of current pen
Q: Quad Draw (turn on & off)
S: Star
I: Instruction Page

            Press Any Key
```

Notice that each command has a letter that actually names a module. For example, *B is the module that allows you to change the background color of your drawing. If you

look at line 410 of the program, you'll see that you can match to any letter of the alphabet. However, the only modules that we've given you are *B, *C, *D, *E, *H, *L, *Q, *S, and *I. The rest are for you to create. Make a shape or form and you can draw with it. Create a new technique. All you must do is turn it into a module (in effect, a PILOT word) and add it to the menu.



*** RAMBRANT THE COMPUTER ARTIST ***

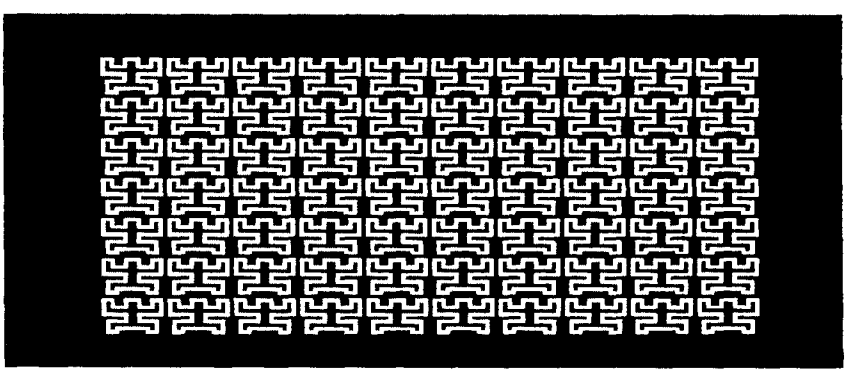
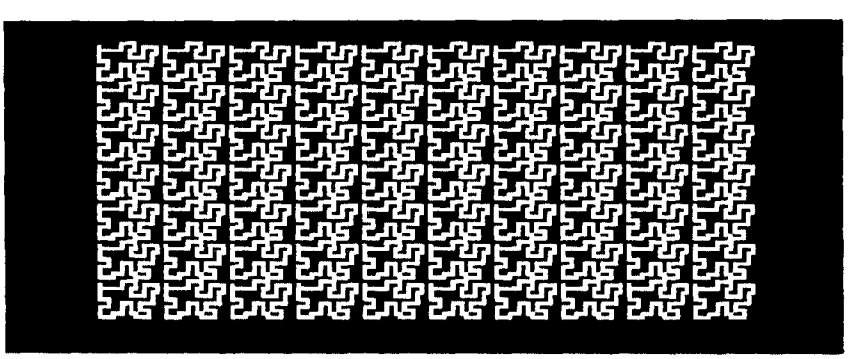
Waves





This program uses a joystick in port 1. It lets you build wave like patterns that are repeated across the screen by moving the joystick. There is no limit to the variety of repeated forms that can be created with it.

3 Word and Language Games

This chapter contains games that range from simple letter recognition to spelling drills, anagrams, codes, and fairly difficult word challenges. It also contains some silly rhymes and letter-writing programs as well as a version of Eliza, where the program has the ATARI Computer simulate a sympathetic psychiatrist. All the programs can easily be modified, reshaped, expanded, and dressed up. With the concepts in the previous two chapters and the introduction to PEEKS and POKES in Appendix II you should be able to turn many of the programs included here into dozens of other games and word challenges.

Guess the Word

We'll begin with a two-person, bare-bones word-guessing program.

```
10 A:$A
20 T:[CLEAR]
30 *LOOP
40 A:$B
50 M:$A
60 JN:*LOOP
70 T:YOU GOT IT!
```

Line 10 accepts a word ($A), line 20 clears the screen, and line 30 sets up a module, *LOOP. In the module a new word (the guess) is accepted and matches line 50 with $A. If there is no match, the program returns to *LOOP and another guess can be made. If the word is guessed correctly, the computer prints: YOU GOT IT.

Here's a slightly dressed-up version of this bare-bones program.

```
5 T:GIVE ME A WORD FOR YOUR FRIEND TO GUESS.
10 A:$A
20 T:[CLEAR]
30 *LOOP
```

```
35 T:GUESS WHAT WORD I GOT FROM YOUR FRIEND?
40 A:$B
50 M:$A
55 TN:SORRY,GUESS AGAIN.
60 JN:*LOOP
70 T:YOU GOT IT!
```

It's best, when typing in a word for your friend to guess, that he or she is out of the room though, of course, the person could just turn away. This two-person routine is used in a number of other programs in this chapter.

Here's a more complex word-guessing game. The second player can guess the word, a letter, or group of letters; the computer will tell him or her whether those letters are in the target word. On line 190 there is a new PILOT command, MS:, which means match with a string of letters.

MS:$WORD matches the letters typed in $GUESS with the letters in $WORD and lets the player know whether there is a letter match. This MS: string matching is convenient when working with words in PILOT.

```
 YES, RD IS IN MY WORD.
TYPE A LETTER THAT YOU THINK MAY BE
IN MY WORD, OR WHAT YOU THINK THE
WORD IS.
 YOUR GUESS? ORD
 YES, ORD IS IN MY WORD.
TYPE A LETTER THAT YOU THINK MAY BE
IN MY WORD, OR WHAT YOU THINK THE
WORD IS.
 YOUR GUESS? CORD
 NO, THAT'S WRONG.
TYPE A LETTER THAT YOU THINK MAY BE
IN MY WORD, OR WHAT YOU THINK THE
WORD IS.
 YOUR GUESS? WORD
```

```

Letter Guessing

In this game the computer gives you a letter, and you must type in a word that begins with that letter. The computer does not check your spelling of the word. It checks only if the first letter that you typed is the one that it requested. It is not a spelling game.

Notice that on line 100 the C: command is used with a string of letters (the alphabet) separated by commas. This is another use of C:. It can handle strings of words and store them. $ALPHA in the case of this program is the alphabet. There are a few other PILOT concepts in this program which may be unfamiliar. They are explained clearly in the PILOT reference manual.

```
   THE LETTER IS: B
 TYPE A WORD THAT BEGINS WITH B.
BAGEL

Simple Spelling Drill 1

This program lets you type in five spelling words and then drills you on them. It flashes each word on the screen and then gives you one chance (or several chances if necessary) to spell it correctly. The computer in this case does check for correct spelling. If you want to have the computer accept a longer spelling list, change lines 190, 420, and 440.

Simple Spelling Drill 2

In this program the computer already has a list of words to drill. We chose five French verbs (there is no reason these two spelling programs can't be used to help people studying foreign languages). By adding $WORD N (for N = 1 to 5) at lines 110 to 150 and adjusting the T(#C =5): at lines 370 and

390, we have a short French drill program. You can substitute any words you care to and also expand the list.

```

Ropirst

Ropirst is similar to Dropspaces. However, it drops the first letter from every word in a sentence. If you want to combine the two programs for a more complex challenge, you would have to add the *DROPSPACES module at line 410 in the Dropspaces program to Ropirst. Try it for a better idea of how powerful the modules in PILOT are.

```
   ROPIRST IS A GAME FOR TWO PLAYERS.
ONE PLAYER TYPES IN A SENTENCE WHILE
THE OTHER PLAYER IS OUT OF THE ROOM.
THE COMPUTER THEN LOOKS AT THE
SENTENCE AND DROPS THE FIRST LETTER
FROM EVERY WORD.

   AFTER THE SECOND PLAYER COMES BACK
IN, HE LOOKS AT THE NEW VERSION OF
THE SENTENCE AND GETS TO TRY TO
FIGURE OUT WHAT THE ORIGINAL SENTENCE
WAS.

       HIT ANY KEY TO BEGIN.

   AFTER DROPPING THE FIRST LETTER OF
EACH WORD, THE SENTENCE IS:

A To Z

The challenge of A to Z is to generate a short list of words that contains all the letters in the alphabet. The computer will check your list and let you know letters not in your list as well as when you've achieved the goal. The program could be made more complex by putting in a word counter and a total letter counter and matching one successful list against another for the shortest number of words or letters. Notice that the letters that you've already used are indicated at the top of the screen in inverse print.

Guess the Code

This program lets you create an alphabet substitute code. The computer then tests you on the code. Modifications to this program could consist of translating words and messages into your code or creating a two-person game where one person wrote a message, the computer translated it into code, and the second person had to decode it. It would also be possible for someone to write a message in code and have the computer decode it.

Cryptogram

Cryptogram is the most elaborate word game in this book. It is playable on four different levels. The alphabet at the top of the screen registers those coded letters that you have decoded correctly. Though it's quite long, it is worth copying since it presents a series of challenges to sophisticated readers as well as to beginners.

```
A CRYPTOGRAM IS A SENTENCE THAT HAS
HAD SOME OR ALL OF ITS LETTERS
CHANGED BY MEANS OF A CODE. IT IS UP
TO YOU, USING ONLY YOUR WITS AND A
FEW OBSERVATIONS ABOUT THE ENGLISH
LANGUAGE, TO FIGURE OUT WHAT THE
SENTENCE IS.

HERE ARE A FEW HINTS TO HELP YOU
ALONG:

 1. THE MOST COMMONLY USED LETTERS IN
ENGLISH ARE E, T, A, O, I, AND N.

 2. BE ON THE LOOKOUT FOR THINGS LIKE
REPEATING LETTERS, SINGLE LETTERS
(CAN ONLY BE "A" OR "I"), ETC.

        HIT ANY KEY TO CONTINUE.

HERE ARE YOUR OPTIONS:
1. EASY SENTENCE, ONLY VOWELS ENCODED.
2. EASY SENTENCE, EVERYTHING ENCODED.
3. HARD SENTENCE, 1/2 OF ALPHABET
   ENCODED.
4. HARD SENTENCE, EVERYTHING ENCODED.

WHICH OPTION DO YOU WANT (1-4)? ■

  ABCDEFGHIJKLMNOPQRSTUVWXYZ

 HAW HUGH CIN YAE JEMP?

 **** ***** *** **** *****?

ENTER YOUR GUESS FOR A LETTER, OR
"GUESS" IF YOU WANT TO GUESS THE
SENTENCE.
■
```

Anagrams

This PILOT version of anagrams has three levels of difficulty. You select a level, decide whether you want hints, and begin the game by using the [OPTION], [SELECT], and [START] keys on the right of the keyboard of the ATARI Computer.

Anagrams are word mixings. An anagram changes around the letters in a word; you must guess the original word. Here is a simple computer-generated anagram from level 1 of our game, along with a correct guess.

```
ABD

BAD
```

Here's a challenge from level 3, the most difficult level. See if you can figure out the word.

```
OAIECRTN

```

The Three Little Pigs

This is a "fractured fairy tale." The computer asks questions such as your name, the name of your best friend, the title of a job that always bugs you, etc. Then the computer substitutes your input into the nursery rhyme to create a slightly fractured, somewhat funny personalized version of "The Three Little Pigs." This is a good program to modify. Change the

questions (see, for example, lines 210, 240, 280, 320, and 360) and change the nursery rhyme to one of your favorites. This program presents a form that you can use in many different ways.

```
        * THE THREE LITTLE PIGS *

ONCE THERE WERE THREE LITTLE PIGS
NAMED DALE, HERB AND TED.

A HUNGRY EDITOR NAMED NIKKI
WANTED TO EAT THEM FOR SUPPER.

TERRIFIED, THEY HID IN THEIR CABIN.
FURIOUS, NIKKI SHOUTED:
"I'LL HUFF, AND I'LL PUFF AND I'LL
MELT YOUR CABIN DOWN!"

NO FOOLS, THE THREE PIGS SNEAKED OUT
THE BACK DOOR AND ESCAPED IN THEIR
MERCEDES.

                * THE END *
```

Typical Form Letter

Here's another program that is easy to modify. It works particularly well with a printer and is like a lot of computer-personalized form letters. We chose a letter from our favorite politician, Senator Windbag. You can change the program to address anyone you care to and say what's on your mind.

```
          OFFICE OF
   THE HONORABLE SENATOR
       RALPH WINDBAG

                  SEPTEMBER 3, 1982

DALE DISHAROON
SEA CYPRESS DRIVE
MANCHESTER, CALIFORNIA 95459

DEAR DALE DISHAROON:

I'D LIKE TO THANK YOU, PERSONALLY,
FOR YOUR GENEROUS CONTRIBUTION OF
```

```
$5.00.  GROUPS LIKE YOURS,
NEEDY AUTHORS CO-OP, WHO ARE
WILLING TO STAND UP AND BE COUNTED,
HAVE MADE IT POSSIBLE FOR US TO
TRIUMPH IN OUR AGGRESSIVE CAMPAIGN
AGAINST DEADLINES!

MANY PEOPLE ARE WORRIED THAT NO ONE
HERE IN THE STATE CAPITAL HAS TIME
FOR SMALL GROUPS LIKE YOURS.
BUT I WANT TO REASSURE YOU,
PERSONALLY, THAT NEEDY AUTHORS CO-OP WILL
ALWAYS BE MY PRIME CONCERN WHILE IN
OFFICE.

                SINCERELY YOURS,
                SENATOR RALPH WINDBAG
```

Eliza or the World's Cheapest Psychiatrist

The Eliza program, first written by Joe Weizenbaum of MIT, is an example of what could be called empty interaction. The computer asks you questions and seems to be responding in a very personal way when in fact it is responding mechanically. Note that at line 240 it matches for misery and responds accordingly. At line 380 it responds to a desire to end the program and at line 530 at negatives. This is an interesting program to study as it is cleverly designed to create the illusion of conversation and consolation. It is also fun (and easy) to modify it and turn Eliza into a Freudian, a sadist, or a callous joker.

```
MY NAME IS ELIZA.  I AM A COMPUTER
PROGRAM.
WHAT IS YOUR NAME? ANDY
HELLO, ANDY.
HOW ARE YOU TODAY? I'M FINE, THANKS.
I AM FEELING FINE, TOO.
PLEASE TELL ME ABOUT YOUR PROBLEMS.
WELL, JUST BETWEEN THE TWO OF US, I'VE
ALWAYS WANTED TO BE A COMPUTER PRO-
GRAMMER. THEY'RE SO FASCINATING.
I SEE, ANDY.
DO YOU IDOLIZE THEM TOO?
LET'S TALK ABOUT YOU, NOT ME.
I THOUGHT AS MUCH. ANYWAY, I THINK
IT'S JUST AWESOME TO HAVE SUCH POWER
AT YOUR FINGERTIPS.
LET'S TALK ABOUT YOU, NOT ME.
WELL, OF COURSE COMPUTER PROGRAMS
DON'T HAVE FINGERS, MUCH LESS FINGER-
TIPS.
AREN'T YOU BEING A BIT NEGATIVE?
NO, JUST FACTUAL.
HMMM. . .
PROFOUND, HUH?
```

Twenty Questions

This last program in the chapter is an Eliza-type program in which the computer is doing nothing but teasing you into thinking that it understands and answers your questions. Possibly a lot of actual human conversation proceeds in such an automatic way.

Notice that in line 260 the program matches for A?, E?, O?, U?, and Y?. Whenever your question ends that way, the computer answers your question YES. Otherwise, the computer answers NO. You can change these match criteria in any way you want.

```
NO

ENTER QUESTION NUMBER 2
IS IT A MINERAL?
NO

ENTER QUESTION NUMBER 3
IS IT GREEN?
NO

ENTER QUESTION NUMBER 4
IS IT ORANGE?
YES

ENTER QUESTION NUMBER 5
IS IT A FRUIT?
NO

ENTER QUESTION NUMBER 6
IS IT A VEGETABLE?
YES

ENTER QUESTION NUMBER 7
IS IT A CARROT?
```

More Modules

Here are a number of word modules that advanced programmers in PILOT can use within their programs:

*NEXTWORD gets you the next word in a string or sentence after a word that you specify.

*COUNTWORDS counts the number of words in a list.

*RTHWORD gives you the Rth word of a list.

*RANDWORD picks a word at random from a list.

*FIRSTWORD gives the first word of a list.

*LASTWORD gives the last word of a list.

*BUTFIRSTWORD gives you all the words in a list except the first word.

*BUTLASTWORD gives you all the words in a list except the last word.

*REVERSE reverses the order of the words in a list.

```

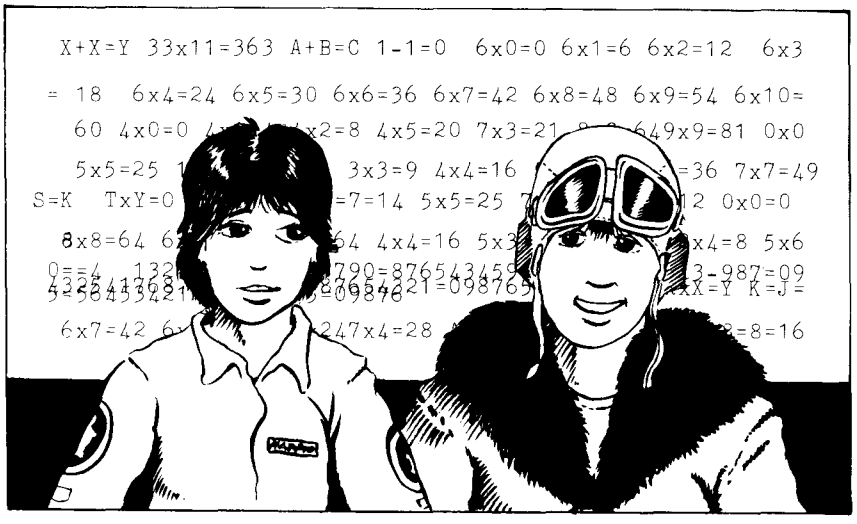
4 Math, Logic, and Strategy



The first programs in this chapter are simple and designed for young people who are learning to master arithmetic. The first program can help 4-, 5-, and 6-year-olds who are just learning numbers and counting.

Simple Counting 1

This program picks a number from 0 to 10 and asks the player to type in the number that comes next. If there is a right answer, another problem comes up. If not, the computer prints TRY AGAIN, and the player has another choice.

```
WHAT NUMBER COMES RIGHT AFTER 3? 4

VERY GOOD!
WHAT NUMBER COMES RIGHT AFTER 5? 6

VERY GOOD!
WHAT NUMBER COMES RIGHT AFTER 1? 3
TRY AGAIN ...
WHAT NUMBER COMES RIGHT AFTER 1? 2

VERY GOOD!
WHAT NUMBER COMES RIGHT AFTER 3? 4

VERY GOOD!
WHAT NUMBER COMES RIGHT AFTER 6? 7
```

```
100 T:[CLEAR]
110 *AGAIN R: CHOOSE RANDOM NUMBER 0-1

250 *OOPS T: TRY AGAIN ...
260 T:
270 J:*TRYAGAIN
280 E:
```

There are a number of simple ways to modify this program to make it more complex. On line 120,

```
120 C:#X=?\11
```

The number 11 can be replaced by any other number according to what you think the players need practice in. For example,

```
120 C:#X=?\50
```

will generate numbers from 0 to 50 for the game.

You can also change lines 140 and 150 to:

```
140 C:#Y=#X+2
150 *TRY AGAIN T:WHAT NUMBER COMES TWO AFTER #X
```

This would be a simple addition problem.

Here are the changes that would create a simple doubling program for numbers from 0 to 15:

```
120 C:#X=?\16
140 C:#Y=#X*2
150 *TRY AGAIN T: WHAT NUMBER IS TWICE AS BIG AS #Y
```

Notice that on line 150 there is a module name as well as a T: command. PILOT allows you to add a command on line that begins with naming a module.

Simple Counting 2

This program differs from Simple Counting 1 in that it presents problems in sets of five and gives the player the choice of playing again or terminating the program.

```
VERY GOOD!

WHAT NUMBER COMES RIGHT AFTER 10? 11
VERY GOOD!

WHAT NUMBER COMES RIGHT AFTER 9? 11
NO, THAT WAS WRONG.

WHAT NUMBER COMES RIGHT AFTER 9? 10
VERY GOOD!

WHAT NUMBER COMES RIGHT AFTER 7? 8
VERY GOOD!

Simple Subtraction Practice

This subtraction program is similar to the addition program. However, it must guarantee that the number subtracted from is larger than the number taken away (for example, 9 − 6 is permitted, but 6 − 9 is not). This is done on line 190, which jumps back to a new choice of numbers if #Y>#X. If you want to use larger numbers, change lines 170 and 180.

```

Simple Division Practice

This division program must guarantee that there will be no remainders. It does this by choosing two numbers, #X and #Y (lines 145 and 150); multiplying them (line 155); and using the answer #W in defining the problem (line 170). For example, if #X = 5 and #Y = 6, then #W = 30 and the problem presented by the computer would be 30÷6.

Getting to 100

In this program you race the computer to 100. You can play any number from 1 to 10. The computer will then play a number which is added to your number. The player who adds the number that makes exactly 100 wins. Here's a possible game:

		TOTAL	
YOU	10		
COMPUTER	3	13	
Y	9	22	
C	10	32	
Y	7	39	
C	9	48	
Y	10	58	
C	10	68	
Y	5	73	
C	9	82	
Y	7	89	
C	9	98	
Y	2	100	YOU WIN

This is a strategy game. If you think it through, there is a decent chance that you can beat the computer.

The bare-bones program that gets you to 100 by adding each number to the total of the previous numbers follows.

```
100 C:#T=0
110 *LOOP A:#X
120 C:#T=#T+#X
130 T:TOTAL=#T
140 J(#T<100):*LOOP
150 T:  YOU WIN.
160 T:
```

Line 120 is the essential one. It keeps a tally and adds your new input (at line 110) to the total each time through *LOOP until 100 is reached.

```
 THE OBJECT OF THIS GAME IS TO BE THE
FIRST TO REACH 100.  YOU MAY USE ONLY
NUMBERS FROM 1 TO 10.

 EACH TIME YOU ENTER A NUMBER IT IS
ADDED TO THE TOTAL.

 TYPE A NUMBER BETWEEN 1 AND 10. 9
              TOTAL=9
MY NUMBER IS 6.
              TOTAL=15

 TYPE A NUMBER BETWEEN 1 AND 10. 10
```

Guess My Number (with Hints)

In this version you can set the maximum number to be chosen by the computer. You will also get hints about whether your number is too high or too low, which should make your guessing strategy more efficient.

```
  I HAVE GUESSED A NUMBER BETWEEN
  1 AND 100.  TRY TO GUESS IT.

    YOUR GUESS? 50
NO, THAT'S TOO LOW.  TRY AGAIN.

    YOUR GUESS? 75
NO, THAT'S TOO HIGH.  TRY AGAIN.

    YOUR GUESS? 62
NO, THAT'S TOO HIGH.  TRY AGAIN.

    YOUR GUESS? 56
NO, THAT'S TOO HIGH.  TRY AGAIN.

    YOUR GUESS? 53
NO, THAT'S TOO HIGH.  TRY AGAIN.

    YOUR GUESS? 52
```

Simple Algebra

Here are some simple algebraic equations generated by the computer for you to solve. You can make them more complex and change the size of the numbers involved. These equations provide a good practice for a beginning algebra student as well as an introduction to algebra for youngsters who haven't been exposed to it.

```
HERE IS A SIMPLE ALGEBRA PROBLEM.

 WHAT IS THE CORRECT VALUE FOR X IF
    9+X=10? 1
WELL DONE!  NOW TRY THIS ONE:

 WHAT IS THE CORRECT VALUE FOR X IF
    6+X=10? 3
      SORRY, TRY AGAIN...
 WHAT IS THE CORRECT VALUE FOR X IF
    6+X=10? 4
WELL DONE!  NOW TRY THIS ONE:

 WHAT IS THE CORRECT VALUE FOR X IF
    7+X=8? 1
```

Binary Boxes

In this game the computer presents you with a series of boxes and asks you two things:

1. Pick any number between 1 and 31.
2. Tell it which boxes the number is in.

The computer will then tell you your number.

```
IN THIS GAME, I WILL HAVE YOU THINK
OF A NUMBER BETWEEN 1 AND 31. I WILL
DISPLAY SOME BOXES OF NUMBERS ON THE
SCREEN, AND WHEN YOU TELL ME WHICH
BOXES CONTAIN YOUR NUMBER, I WILL BE
ABLE TO FIGURE OUT WHAT YOUR NUMBER
IS. SIMPLE, HUH?

          HIT ANY KEY TO BEGIN.
```

#1

1	3	5	7
9	11	13	15
17	19	21	23
25	27	29	31

#2

2	3	6	7
10	11	14	15
18	19	22	23
26	27	30	31

#3

4	5	6	7
12	13	14	15
20	21	22	23
28	29	30	31

#4

8	9	10	11
12	13	14	15
24	25	26	27
28	29	30	31

```
PICK A NUMBER
BETWEEN 1 & 31.

WHAT BOXES
CONTAIN YOUR
NUMBER? 2,3,4■
```

#5

16	17	18	19
20	21	22	23
24	25	26	27
28	29	30	31

In this case the chosen number was 14; the computer's response follows.

#1

1	3	5	7
9	11	13	15
17	19	21	23
25	27	29	31

#2

2	3	6	7
10	11	14	15
18	19	22	23
26	27	30	31

#3

4	5	6	7
12	13	14	15
20	21	22	23
28	29	30	31

#4

8	9	10	11
12	13	14	15
24	25	26	27
28	29	30	31

```
YOUR NUMBER WAS 14.
```

#5

16	17	18	19
20	21	22	23
24	25	26	27
28	29	30	31

Why did the computer guess correctly and easily? Notice the first number in each box—1, 2, 4, 8, 16—or, written in base 2 notation, 2^0, 2^1, 2^2, 2^3, 2^4. Fourteen was in boxes 2, 3, and 4, which added together make $2^1 + 2^2 + 2^3 = 2 + 4 + 8 = 14$. Try any other number and express as a power of 2 according to the boxes it appears in. For example, 25 is in

boxes 1, 4, and 5. That would mean $2^1 + 2^4 + 2^5 = 1 + 8 + 16 = 25$.

In order to see whether you understand how this works, try to figure out why all the odd numbers from 1 to 31 are in box 1.

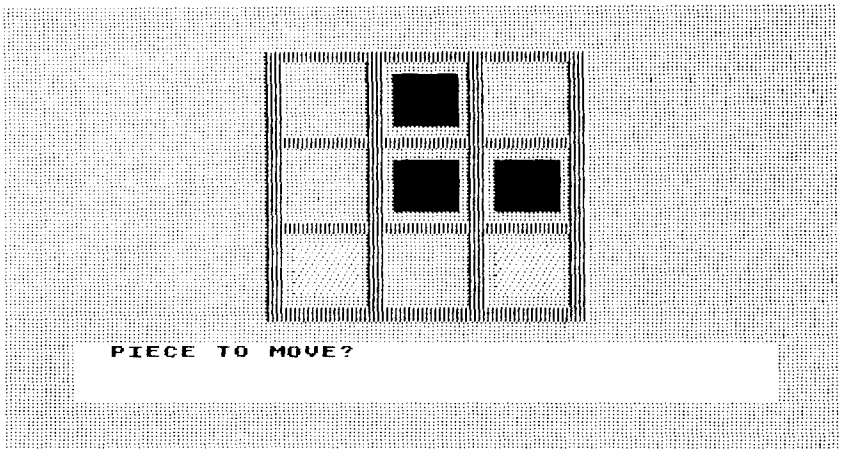
Pawns

The game is played on a 3 × 3 board, with pieces that move in the same way as pawns do in chess. You have three blue pawns, and the computer, your opponent, has three red ones.

The object of the game is to get one of your pawns to the other side of the board, without allowing your opponent to do the same. The first contestant to reach the opposite side wins. (To be honest, though, you may find winning impossible!)

A piece may move only forward one space if it is clear, or one space diagonally forward to capture an enemy piece. Play continues until somebody wins, or a stalemate occurs.

The game requires a joystick, which goes into port 1 of the ATARI Computer.



```

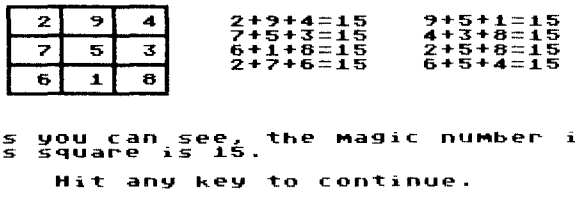
Lo Shu Squares

A Lo Shu Square is more commonly known as a magic square in America. It is a square that contains numbers arranged in such a way that the numbers in each row, column, and corner-to-corner diagonal add up to the same number.

Here is an example of a 3*3 Lo Shu Square.



As you can see, the magic number in this square is 15.

One-Player Game. The computer constructs a Lo Shu Square of a given size (3 – 5) but leaves some boxes blank. You must figure out which numbers go in which boxes.

To do this, use the joystick to position the white square in the box that you choose, and press the fire button. Then select the number that you wish to put there. Moving the joystick forward will make the number go down, and pulling it back will make it go up. When you reach the number that you want, press the fire button again, and then you're ready to move on.

Two-Player Game. The computer once again constructs a Lo Shu Square of a given size. This time, however, one player is asked to leave the room. After this happens, the computer draws the board and allows the remaining player to use the joystick to switch any two boxes.

After the boxes have been switched, the first player comes back and must determine which two boxes were switched. This is done by positioning the white square over the first number, pressing the fire button, and then positioning the square over the other number and pressing the fire button. The computer will let the player know if the answer is right.

Pico Fermi Bagel—ATARI PILOT Version

Pico Fermi Bagel is a simple game to learn. The computer picks a number of a certain length, and you try to discover it. You do this by picking a number. The computer then tells you how many digits are correct and in the right position ("perfect"), and how many are correct but in the wrong position ("close").

The option "non-repeating digits" allows you to force the computer to choose a number where all of its digits are different. This is a slightly easier version of the game.

A sample four-digit game follows.

```
                        PERFECT    CLOSE
1. GUESS? 1234            0          1
2. GUESS? 5678            0          2
3. GUESS? 9009            0          1
4. GUESS? 2967            1          0
5. GUESS? 2850            0          2
6. GUESS? 3985            0          1
7. GUESS? 0547            3          0
8. GUESS? 0517
   YOU GOT IT!!
WANT TO PLAY AGAIN? Y

Nim

NIM is an ancient Chinese gambling game that is usually played with matches. A simple version played with two piles of matches is easy to figure out. Some gamblers use the two-pile version to lure people into playing more complex versions where figuring out a winning strategy is not so easy. Here's the setup for a two-pile version of NIM. (There can be any number of matches in either pile.)

(Pile I)

(Pile II)

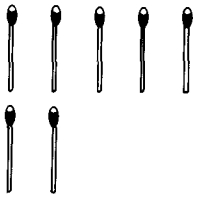
The players are to take turns removing as many matches as they please (at least one) from one of the piles. The players are free to decide which of the piles they will take matches from. The players can also decide whether the object of the game is to take the last match or to force one's opponent to take the last match. Here's an example of the game with the winner being the player who takes the last match:

Setup:

(I)

(II)

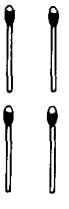
Player 1 (takes 3 matches from pile II):



(I)

(II)

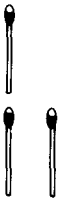
Player 2 (takes 3 matches from pile I):



(I)

(II)

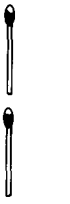
Player 1 (takes 1 match from pile I):



(I)

(II)

Player 2 (takes 1 match from pile II, thus forcing a win for him or herself since Player 1 can only draw matches from one column):



(I)

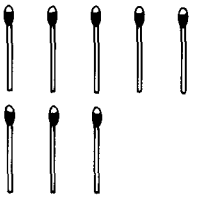
(II)

Player 1 takes match from pile I and Player 2 gets the last match:

(I)

(II)

In this version of the two-pile game, the strategy is to force your opponent to draw from two equal piles. You can then keep equalizing the piles until you get last draw. Here's a simple version of the strategy:

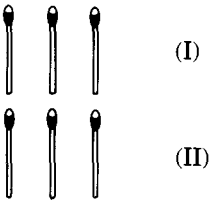


(I)

(II)

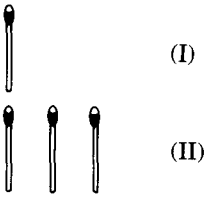
If the first player takes two matches from I, equalizing the columns, the second player can be forced to lose:

After player 1 moves:



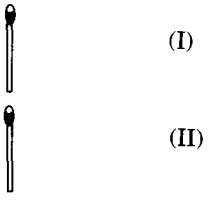
Now the second player can pick from either pile and will still be forced to face equal columns.

Player 2 moves, taking two from column I

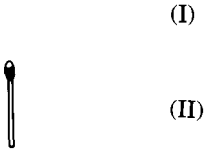


and player 1 counters by equalizing the columns and forcing a win (by guaranteeing that he or she will get the last match).

Player 1:

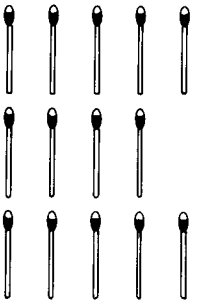


Player 2:



Player 2 takes the last match and wins.

The game of NIM becomes much more complex when three or more piles of matches are involved. Here's a game involving three piles. The rules are the same. Try this a few times before entering the more complex world of NIM that you can explore with the ATARI Computer:

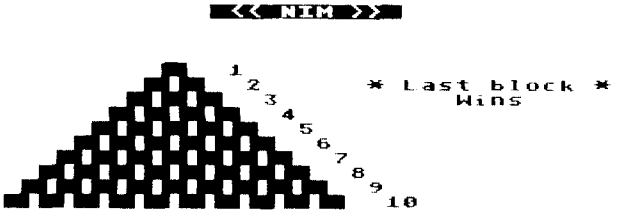


(I)

(II)

(III)

The player to take the last match wins.



```
Player #1 takes from level - ?3
Player #1 takes how many - ?
```

Dodgem

Dodgem is a complex game played on a simple board. We first discovered the game as a 3 × 3 board version in Martin Gardner's "Mathematical Games" column in *Scientific American*. According to Gardner, the game was developed in 1972 by Colin Vout, a mathematics student at the University of Cambridge. We made a 4 × 4 version for ATARI PILOT. Here are the instructions.

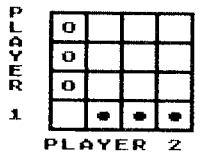
Dodgem is a two-player game. Each player has three pieces. The object of the game is to be the first player to get all one's pieces to the opposite side of the board.

The game is an essentially peaceful one: there is no capturing or jumping of your pieces. Rather, each piece must work its way across the board by moving only where there is an open space.

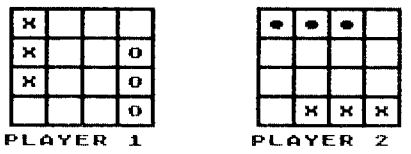
Rules of movement are that players may move their pieces only forward or sideways, not backward. Again, movement can only occur to an empty space.

Any move that one player makes must leave the opponent a valid move—"boxing up" is not allowed.

Here is the board as the game first begins:



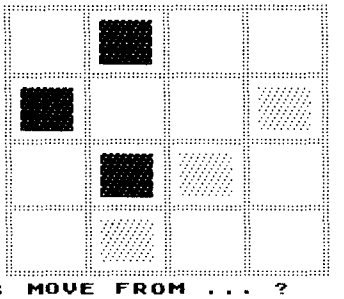
Here are Players 1 and 2 shown in winning positions:



Note the vertical/horizontal change in positions of the respective pieces.

You will need two joysticks to play. To make your move, use your joystick to position the blinking dot in the square containing the piece you want to move. Press the fire button to indicate to the computer which piece to move.

Then position the dot in the square where you want to move to, and press the fire button. The computer automatically checks for a valid move. If you try to make an illegal move, the computer will tell you to try again.



```
PLAYER 1: MOVE FROM ... ?
```

```

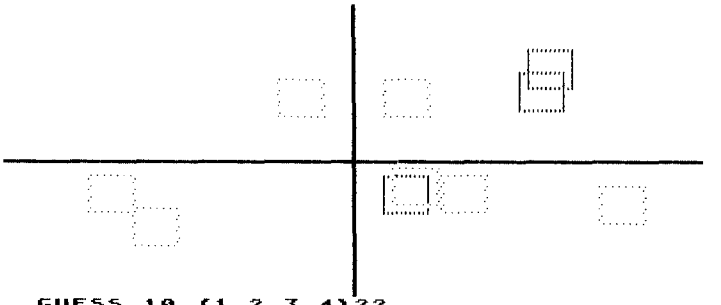
ESP

This is an extrasensory perception (ESP) game. The computer presents a grid with four quadrants. The computer then picks one quadrant in which to place a square. You can't see the choice but must concentrate and try to perceive the computer's choice. You can take either 10 or 30 turns. Chance guessing would make approximately 25 percent of your guesses right. If your guesses are greater than chance, you may have ESP—or be lucky. Try again.



```
GUESS 10 (1,2,3,4)?2
CORRECT!  YOU HAVE 3 OUT OF 10.
```

```

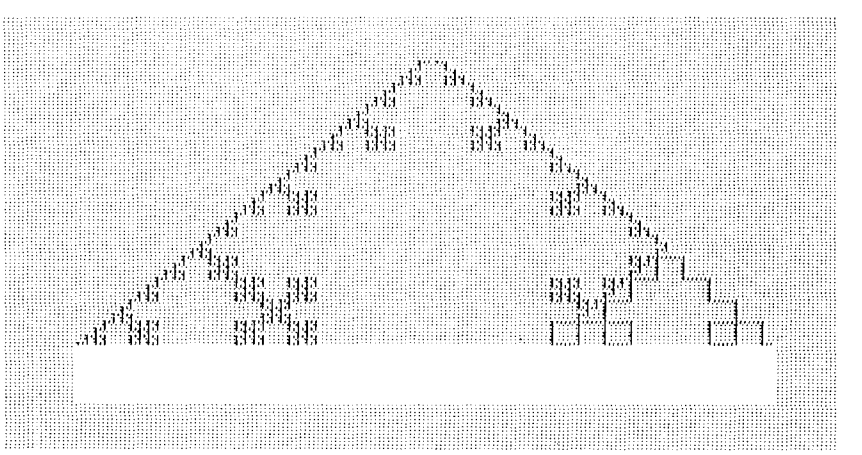
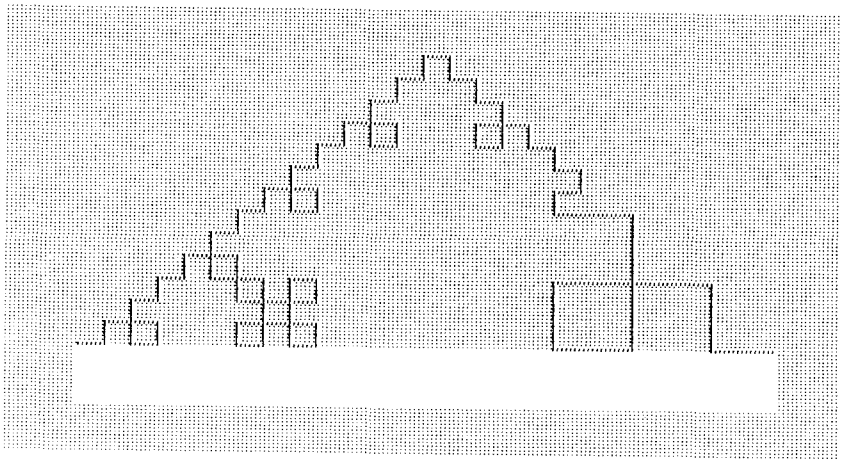
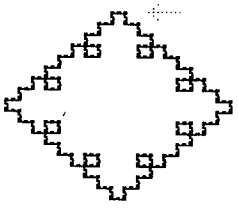
Fractals

To understand fractals, think of two mirrors facing each other with a person standing between the mirrors. If you stand a bit to the side and look in one mirror, you'll see an infinite regression of mirrors reflecting the person and mirroring themselves reflecting the person. A fractal is somewhat like this. A *fractal* is a curve, each part of which approximates the whole structure. At the bottom of this page and the top of the next, you will find two pictures of a growing fractal, one beginning to turn in on itself to mirror its own shape.

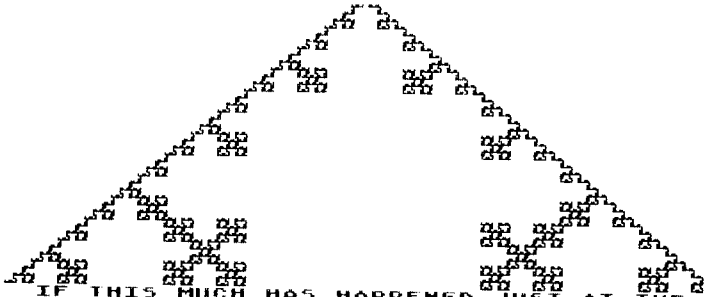
Here are two pictures of more detailed fractals and a program to generate them. If, after you play with this program, you are more interested in fractals, read David Thornberg's article on fractals in *Computer,* July 1982, and write to him for additional resources.







NOW WE'RE GOING TO TURN THE COMPUTER
INTO A 50X MICROSCOPE AND LOOK AT
WHAT'S HAPPENING AT THE TOP OF THE
VERY TOP BOX. HIT ANY KEY TO GO.



IF THIS MUCH HAS HAPPENED JUST AT THE
TOP, IMAGINE WHAT THE REST OF THE
SQUARE MUST LOOK LIKE! HIT ANY KEY TO
SEE.

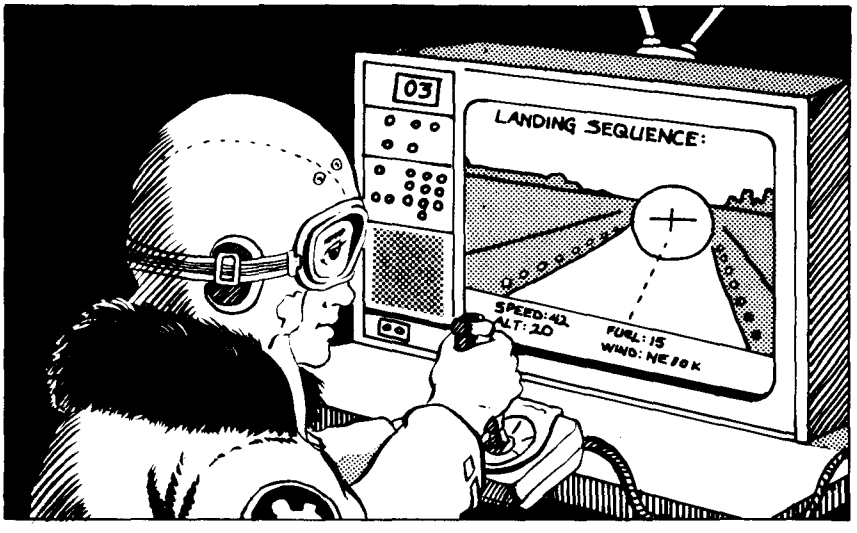
5 Adventure Games, Modeling, and Miniworlds



Scout Ship—An Adventure

We began this book with a simple monster adventure. Now we'll share a more complex adventure, one developed by Dale Disharoon and two of his students, Jeremiah Knoche and Miles Pickering, who are in junior and senior high school, respectively. The adventure, which is called Scout Ship, is easy to modify; we welcome you to change it and to develop your own adventures. Here is how you begin the adventure.

```
YOU HAVE BEAMED ABOARD AN ALIEN SPACE
CRAFT.  MOST OF THE ALIEN CREW ARE
NOT ONBOARD YET.  YOUR MISSION IS TO
DESTROY THE SHIP AND TRANSPORT
YOURSELF OUT, ALIVE.

TO DESTROY THE SHIP YOU MUST FIND AN
EXPLOSIVE, ARM IT AND ACTIVATE IT
NEAR THE SHIP'S ENGINES.

TRANSPORT TO SAFETY BY USING THE
COMMAND 'TRANSPORT'.

TO MOVE: TYPE THE 'LETTER' OF AN OPEN
CORRIDOR.  IF YOU NEED HELP DURING
THE GAME, TYPE 'HELP'.

GOOD LUCK...

PRESS START
```

Here are the words that you can use during the game as well as a map of the alien craft.

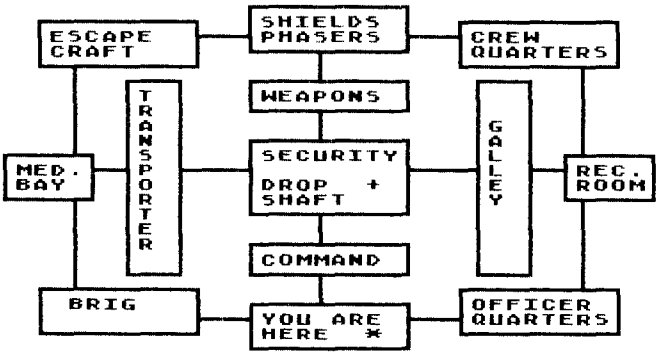
```
THESE ARE SOME OF THE WORDS I KNOW.

VERBS:                  NOUNS:

TAKE    SEARCH          COIN            WEED
DROP    LAUNCH          CRAFT           BOMB
PRESS   SHOOT           PHASER          GLOBE
SAY     INSERT          CARD            START
READ    LOOK            CARTRIDGE       LASER
EAT     INVENTORY       SOYBURGER       PAN
BREAK   TRANSPORT       SUNGLASSES      TRION
CUT     ACTIVATE        MANUAL          FLUID
FEED                    CHEST           GUARD

Try drawing a simple map as you go.

WHAT NOW?
```



The two screen dumps should give an idea of what the screen might look like during the game.

```
MAIN COMPUTER SECTION:  The huge bulk
of the computer dominates the room.

POSSIBLE EXITS . . .

     CORRIDOR   B
     CORRIDOR   I
     CORRIDOR   P

WHAT NOW?  FIND JOYSTICK

THE JOYSTICK  IS HARD TO FIND.

WHAT NOW?  PRESS START

The computer comes quietly to life.
and says . . .
```

```
ENERGY STORAGE:  A huge pulsating
glass globe showers the room with an
eerie pink glow.  There is a small
cutting laser here.

POSSIBLE EXITS . . .

     CORRIDOR   T

WHAT NOW?  ACTIVATE BOMB

The bomb must be on the floor in
ENGINE ROOM before you detonate it.

WHAT NOW?
```

Notice that lines 160 to 260 name, use, or jump to modules. To familiarize yourself with how the program works, look at those modules before trying to copy the program. Also look at line 2360, *COMPUTER. You'll find one of the number-guessing games that we included in the Math chapter embedded in the adventure as a challenge. In PILOT it's easy to turn a whole game into a module and call it up at any time that you want in a longer and more complex program.

Play Scout Ship a bit and then add your own touches.

```

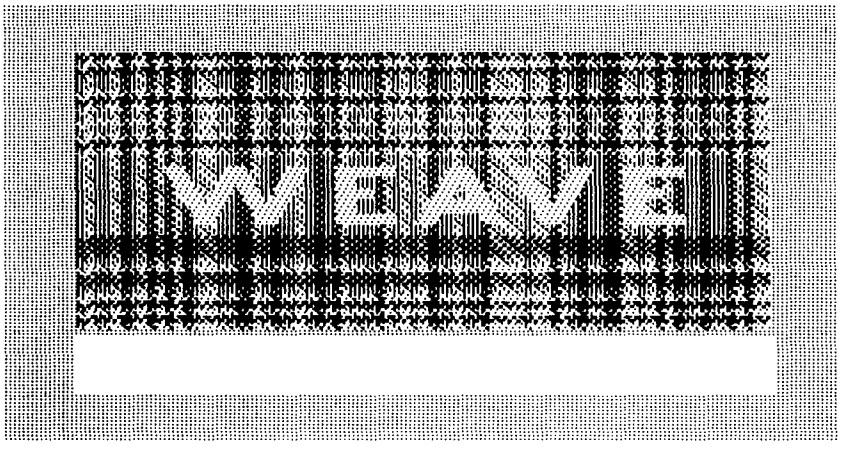
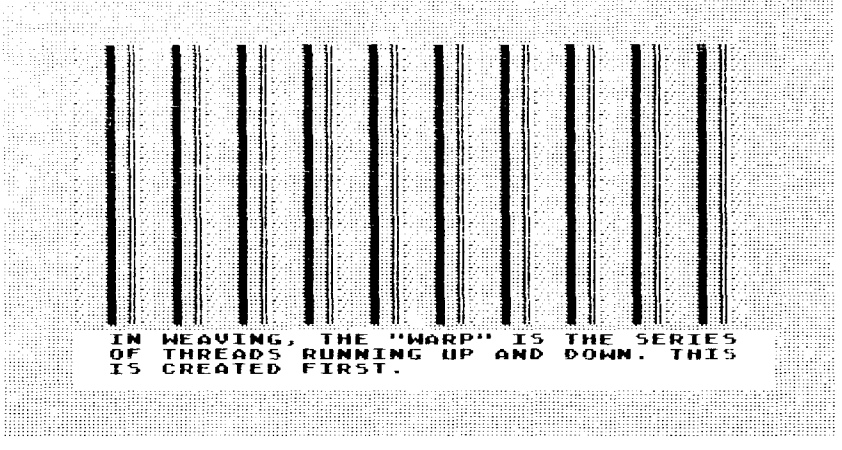
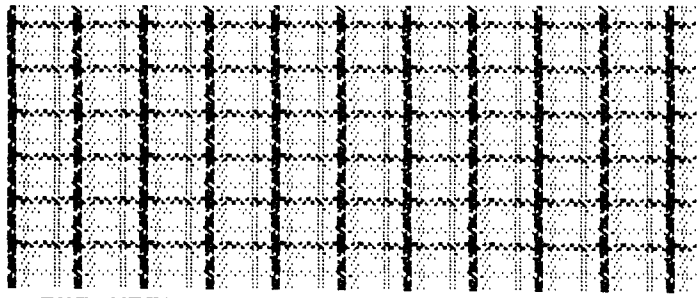
Weave

The computer can be used to model events and processes in the world. In order to show what a computer modeling program is like, we developed a weaving program. The program describes how weaving is done and then allows you to weave your own patterns. You create your own warp and then weave through it with your weft. Each time you create a pattern, you can weave with anywhere from one to eight threads of the same color.

On the surface your weaving is restricted to the three PILOT pen colors and black, the background color. However, combining stripes of colors in the right way creates browns, greens, purples, and many other colors. For example, single alternating threads of yellow and blue will produce a pale green. This is a program to try many times. After a while you'll be able to control pattern and color, and design handsome fabrics that could actually be woven.







THE WEFT IS THE SERIES OF THREADS RUNNING ACROSS, GOING OVER AND THEN UNDER EACH THREAD OF THE ORIGINAL WARP.

If you look through the program, you'll notice a graphic symbol that we haven't yet introduced. The symbol is %; it is used to create four graphics variables: %X, %Y, %A, and %Z. You cannot assign values to these variables or change their values. These variables tell you at any point in a program where the turtle is, what direction it is pointing, and what color the screen is at its current location. They do this in the following way (notice that they are preceded by a T: command):

T:%X = X coordinate of the turtle

T:%Y = Y coordinate of the turtle

T:%A = The angle the turtle is facing

T:%Z = 0 (ERASE or background color) or
1 (RED) or
2 (YELLOW) or
3 (BLUE)

(The T:%Z command must always be preceded by a GR:GO 0 command.)

These variables are convenient. For example, in the simple program

```
10 GR:PEN BLUE
20 GR:TURN 50
30 GR:DRAW 40
```

these variables will let you know exactly where you end up. In this case, for example,

1. T:%X = 31
2. T:%Y = 26
3. GR:GO 0

T:%Z = 3

4. T:%A = 50

This gives you the information that the turtle is at 31,26, turned to 50°, and has a BLUE pen, which is not that easy to obtain otherwise. Even more important is the fact that these variables can be used in your program to determine further movement of the turtle. The weaving program makes use of this quite extensively. For example, lines 1120 to 1320, which determine how the pattern is drawn, all use these % variables to orient and control the turtle.

Earth

Earth is a short program that illustrates how you can model a three-dimension sphere using PILOT turtle graphics. This program can be added to; it is possible to make the sphere seem to be spinning or moving. You may want to turn the whole program into a module for future use.

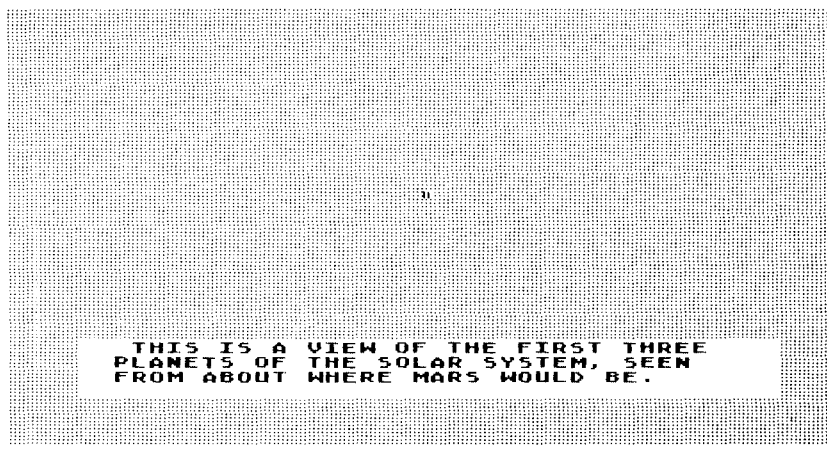
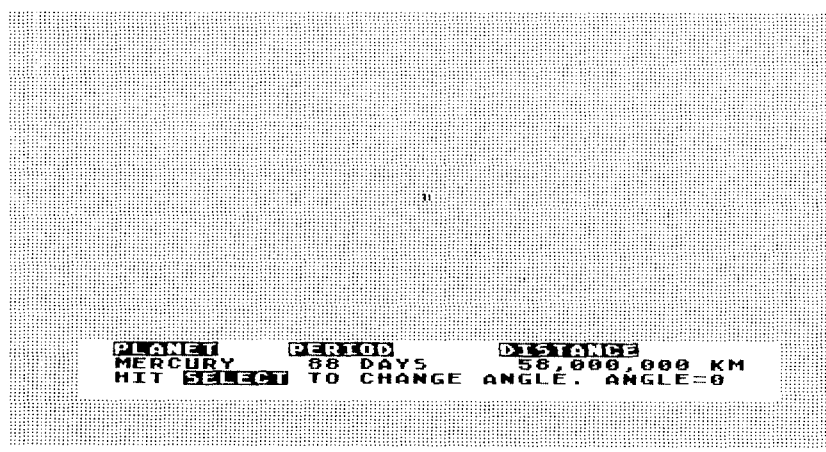
Orbit

Orbit is a dynamic program that uses ATARI Computer missile graphics. It is hard to picture using a screen dump since it involves constant movement. It presents a view of the first three planets from the sun—Mercury, Venus, and Earth—as seen orbiting around the sun from Mars.





You can change the angle from which you see the planets orbiting about the sun. Watching the program run for a while and experimenting with the angle of vision gives one an uncanny sense of actually being in space and seeing planetary movement speeded up. The model shows conjunctions of planets, shows the relative speed of the three planets, and, in ways

a static picture never could, shows how different planetary bodies are constantly changing their positions relative to each other.

Metagame

We end with a metagame, that is, a game to help organize your ideas and invent new games. This game is a bit like Eliza, our psychiatrist, in that the computer prompts you but doesn't actually use the specific information that you provide it. However, it does repeat and organize it in a way that can lead to the production of interesting games. This is not a trick program as Eliza was. It is a tool of thought, an instrument of provocation, a game about games.

```
METAGAME
WRITTEN BY
TED M. KAHN

(INSPIRED BY HESSE'S GLASS BEAD
GAME, M. CASPI'S 'EDUCOMBINATORICS,'
& PICODYNE CORP.)

HAVE YOU EVER WONDERED HOW YOU COULD
COME UP WITH NEW IDEAS FOR GAMES?

IF SO, THEN WELCOME TO METAGAME.
THIS IS AN EXERCISE IN USING YOUR OWN
CREATIVITY.  BY WEAVING DIFFERENT
GAME ELEMENTS TOGETHER (SOME GATHERED
FROM STRANGE PLACES), YOU MAY COME UP
WITH NEW COMBINATIONS WHICH MAY LEAD
TO WONDERFUL NEW GAME IDEAS FOR YOU
TO PROGRAM ON YOUR ATARI COMPUTER.

TO SHOW YOU HOW IT WORKS, LET'S WORK
THROUGH AN EXAMPLE...

(PRESS RETURN WHEN READY)

Appendix I A Guide to Understanding Our Codes

The program listings in this book use a simple code to represent graphics characters, inverse letters, and special function keys. The chart shows all the codes that may be used.

1. Whenever you see a letter in brackets, hold down the [CTRL] key and type the letter. This will generate a special graphics character. If a program listing contained the code [T], you would hold the [CTRL] key and press the [T] key. This will produce a small ball shape.

2. When a graphics character is repeated, it will be shown in an abbreviated fashion. Four small ball shapes would be shown as [4(T)], not [T][T][T][T].

3. Different graphics characters to be printed together are represented like this: [TS]. This tells you to hold the [CTRL] key and then press the [T], followed by the [S] key. A small ball and a cross shape will appear.

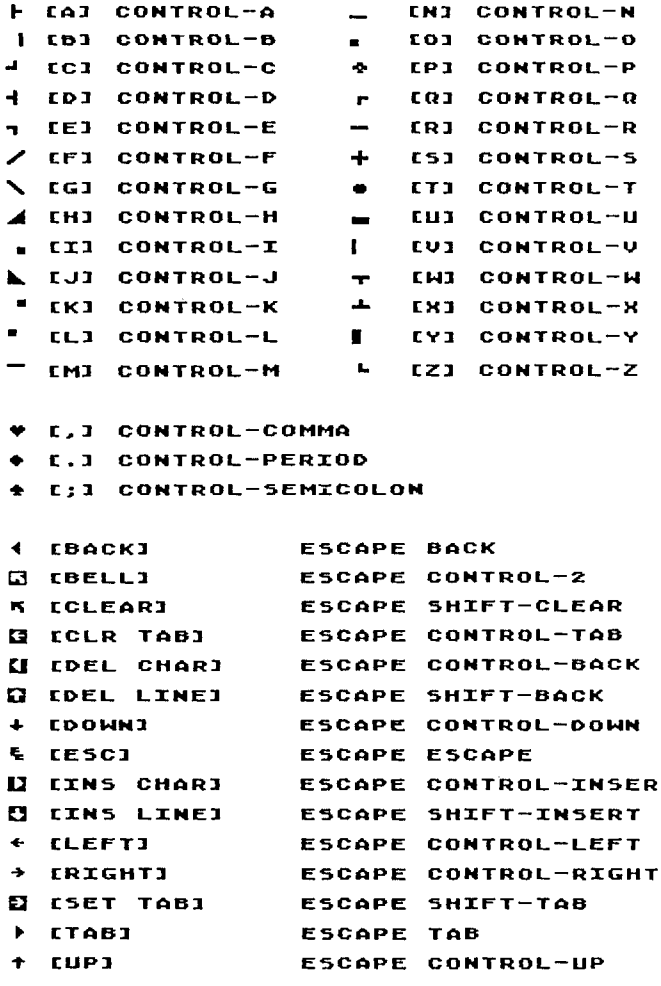
4. Three sets of small ball [T] and cross [S] would be coded like this: [3(TS)]. This is really an abbreviation of [T][S][T][S][T][S].

5. Remember not to type the brackets. The brackets are only there to show you that a special character code is coming. When you are copying a program, type in the actual character, not our code.

6. Special escape function keys like [CLEAR SCREEN], [BELL], and [DELETE LINE] are spelled in an abbreviated form within brackets. If you saw the code [CLEAR], you would press the [ESCAPE] key once and then hold the [SHIFT] key while you press the [CLEAR] key. This will print as a curving arrow character and when printed would clear the screen.

7. Anything in the program listings that is underlined should be typed in inverse characters. Press the ATARI Computer key for inverse print.

8. If you see a special graphics code underlined, as in [T], you should press the ATARI Computer inverse key, hold the [CTRL] key, and then press the [T] key. Finally, remember to press the ATARI Computer key again to turn off the inverse character mode.



Appendix II

PILOT Peeks and Pokes

Your computer is like a post office that contains many, many individual post office boxes. In the computer each box is called a memory location; like the numbered post office box, each memory location is labeled with a number. This number is called the memory location's address. Each memory location in your computer can hold one number. For instance, memory location 10 might be holding the number 0. Location 29998 might hold the number 255. The number contained in the memory location must be in the range of 0 to 255.

Here we've collected a group of memory addresses that can be useful when you are programming in PILOT. Each of these memory locations has a special function that you can use. By placing certain values in the location, you will notice many different kinds of effects.

In PILOT we use a special form of the COMPUTE (C:) statement to place values into memory locations. This form uses the @ symbol with a B and means "at byte number." Thus @B100 means "at byte 100." For example, to put the value 0 into location 710 you would type

```
C:@B710=0
```

If you try this one, you will notice that your television screen turns black. This is because location 710 holds the value for the color of your text screen. Here's another one to try:

```
C:@B82=20
```

If you enter this statement, you will notice that your left-hand margin has changed just a bit. Location 82 normally contains the value 2, which is your normal left-hand screen margin. We have just set it to 20, which is half way across the screen. To reset the margin you can press the [SYSTEM RESET] key or use the following statement:

```
C:@B82=2
```

Some of our programs place a value in a memory by using a numeric variable for either the location address or the value. We could write

```
C:#L=82
C:#V=2
C:@B#L=#V
```

Sometimes you will need to know what value is already in a particular memory location. Type

```
C:#V=@B82
```

After executing this statement, the variable #V will contain the value currently in location 82. You may also use the statement like this:

```
T:@B82
```

If your margin is at its usual setting, you will get a value of 2. Each program that follows will introduce you to one or more useful memory locations. This, of course, is not a complete collection of possible uses or locations. After all, the ATARI Computer contains thousands of memory locations; the number of possible uses is entirely up to you and your creativity.

Clock Demo

The ATARI Computer contains an internal clock, which is constantly being updated. The clock is tied to the television frame counter and thus ticks in 60ths of a second rather than whole seconds. This little demonstration will reset the clock locations to zero and then display their contents on the screen. You will notice that location 20 is the one that increases by 60ths of a second. Every time location 20 reaches the value of 256, it is reset to zero and location 19 is increased by one. Location 19 and 18 behave in a similar manner.

```
100 R: *** CLOCK DEMO ***
110 C:@B18=0
120 C:@B19=0

170 POS:2,4
180 T:LOCATION 19 = @B19  [
190 POS:2,6
200 T:LOCATION 18 = @B18  [
210 J:*LOOP
```

Left Margin

Here's one that we already played with. Location 82 holds the value of the left-hand screen margin. It is normally set to 2. You will find it useful for positioning text in the center of the screen. You may also want to play with location 83, which holds the value of the right-hand screen margin.

```
100 R:*** LEFT MARGIN DEMO ***
110 C:@B82=5

150 T:
160 T:MARGIN 10
170 C:@B82=15
180 T:
190 T:MARGIN 15
```

Moving Left Margin

As you will see in this program, the margin setting can be used in a playful manner to create interesting animated screen displays.

```
100 R: *** MOVING MARGIN DEMO ***
110 *LOOP
120 C:#M=#M+1
130 C(#M>22):#M=1
140 C:@B82=#M
150 T:MOVING MARGINS
160 J:*LOOP
```

Color Text Screen

In order to make use of the color text modes in PILOT, you must change the contents of memory location 1373 and 1374. When location 1373 contains a zero, there will be no blue text window at the bottom of the screen. Placing a value of 16 in location 1373 will enable the text window. The value in location 1374 determines the size of colored letters. This program will demonstrate both letter sizes with and without the text window.

```
100 R:*** COLOR TEXT SCREEN DEMO ***

300 WRITE:S, LONGER LETTERS
310 WRITE:S, TALLER LETTERS
320 WRITE:S, TEXT WINDOW
330 PA:180
```

Position on Color Text Screen

This program enables a color text screen and then prints in different places on the screen. The PILOT word POS: however, has no effect in this mode. We therefore use the memory location 85 to set the horizontal coordinate and location 84 to set the vertical coordinate of our position. This program prints the word THERE at POS:4,9 and the word WHERE? at POS:10,3.

```
100 R: POSITION ON COLOR TEXT SCREEN
110 R: @B85 IS X POSITION
120 R: @B84 IS Y POSITION
130 C:@B1373=16
140 C:@B1374=1

Color Registers

Locations 708, 709, 710, 711, and 712 are possibly the most useful to the PILOT programmer. These locations contain the color values that will be used when you specify PENRED, PENYELLOW, PENBLUE, and PENERASE.

708 = PENRED
709 = PENYELLOW
710 = PENBLUE
711 = Affects only the color text mode
712 = BACKGROUND COLOR

To create a different color set, multiply the memory location to your color choice (0–15) times 16 plus the brightness value (0–14 even). This is one that you will really need to play around with.

```
100 R: *** COLOR REGISTERS ***
110 GR:CLEAR
120 GR:PENRED
130 GR:GOTO 79,25;FILLTO 79,45
140 GR:PENYELLOW
150 GR:GOTO 79,5;FILLTO 79,25
160 GR:PENBLUE
170 GR:GOTO 79,-15;FILLTO 79,5
180 C:@B708=0*16+14
190 C:@B709=12*16+8
200 C:@B710=3*16+10
210 C:@B712=5*16+4
```

Random Color Registers

The color memory locations 708 through 712 are called the color registers. This program chooses a random color register and fills it with a random color and brightness value. It then loops back and does the same thing again very quickly.

```
100 R:*** RANDOM COLOR REGISTERS ***
110 GR:CLEAR
120 GR:PENRED
130 GR:GOTO 79,25;FILLTO 79,45
140 GR:PENYELLOW
150 GR:GOTO 79,5;FILLTO 79,25
160 GR:PENBLUE
170 GR:GOTO 79,-15;FILLTO 79,5
180 *LOOP
```

```
100 R: START-SELECT-OPTION KEY DEMO
110 T:
120 T:Press START, SELECT or OPTION
130 T:
140 *LOOP
150 C:#C=@B53279
160 T(#C=6):YOU PRESSED START
170 T(#C=5):YOU PRESSED SELECT
180 T(#C=3):YOU PRESSED OPTION
190 J:*LOOP
```

Direct Sound Register Control

You may bypass the PILOT sound command and work directly with the sound register locations to create a variety of sound effects. Each sound channel has a memory location that contains the frequency to be played and another location that controls the quality of the sound and its volume.

53760 = SOUND 1 FREQUENCY
53761 = SOUND 1 CONTROL
53762 = SOUND 2 FREQUENCY
53763 = SOUND 2 CONTROL
53764 = SOUND 3 FREQUENCY
53765 = SOUND 3 CONTROL
53766 = SOUND 4 FREQUENCY
53767 = SOUND 4 CONTROL

```
100 R: *** DIRECT SOUND CONTROL ***
110 C:@B53761=10*16+8
120 *LOOP
130 POS:2,2
140 T:PITCH=#P
150 C:@B53760=#P
160 C:#P=#P+1
170 J(#P<256):*LOOP
```

```
190 C:#R=?\5+708
200 C:#H=?\16
210 C:#L=?\7+4
220 C:@B#R=#H*16+#L
230 J:*LOOP
```

Keyboard Codes

Memory location 764 is special in that it is set to a different value each time a different key is pressed on the computer keyboard. This program prints a list of all the letter and number codes and then allows you to try them on your own.

```
100 R:KEYBOARD CODES FROM ** 764 **
110 POS:7,4
120 T:PRESS KEYS TO SEE KEY CODES
130 POS:2,14
140 T:A=63  H=57  O=8   V=16  3=26
150 T:B=21  I=13  P=10  W=46  4=24
160 T:C=18  J=1   Q=47  X=22  5=29
170 T:D=58  K=5   R=40  Y=43  6=27
180 T:E=42  L=0   S=62  Z=23  7=51
190 T:F=56  M=37  T=45  1=31  8=53
200 T:G=61  N=35  U=11  2=30  9=48
210 *LOOP
220 POS:18,6
230 T:@B764  [
240 J:*LOOP
```

Input Demo

This program uses the keyboard code at location 764 to simplify input from the keyboard. The code for the letter *Y* is 43 and the code for *N* is 35. We can therefore tell whether the user is responding with a *yes* or *no*.

```
100 R: *** INPUT WITH 764 ***
110 T:
120 T:DO YOU HAVE ANY WOOL (Y/N)
130 T:
140 *LOOP
150 C:#K=@B764
160 T(#K=43):YES SIR, YES SIR
170 T(#K=35):NO SIR, NO SIR
180 C(#K<>255):@B764=255
190 J:*LOOP
```

Start-Select-Option Keys

Location 53279 is used to determine which of the console keys is being pressed.

7 = No button is being pressed

6 = The [START] key is pressed

5 = The [SELECT] key is pressed

3 = The [OPTION] key is pressed

ATARI® PILOT Activities and Games

Herb Kohl / Ted Kahn / Dale Disharoon

Would you like to draw designs and shapes, move objects on the screen, and develop word and number games on your ATARI® Home Computer? It's fun, it's entertaining, *and* it's easy to learn! What makes it simple is the PILOT programming language—a language that allows you to design complex programs using simple commands. **ATARI® PILOT Activities and Games** is filled with word and language games, math activities, sound and graphics activities (including how to animate objects), and even a chapter on adventure games, modeling events, and miniworlds! Whether you're young or old, you won't be able to put this book down once you start programming in PILOT. Your computer becomes your window to new adventures, new experiences, and new insights—so get ready to find out what ATARI® PILOT has in store for you!
