Error Codes	15

PROGRAM COMMANDS

Command	Examples	Brief Summary
	AUTO AUTO 10,10	Numbers program lines automatically. If only the command is used, the first line is 100 and the increment between line numbers is 10. In the second example, the first line is 10, the second line 20, and so on.
	CLOAD	Loads a tokenized BASIC program into memory from cassette tape.
	CONT	Continues the program execution after BREAK or STOP.
	CSAVE	Stores a program in memory to a cassette tape in tokenized format.
	DEL 10 DEL 10-100 DEL 10- DEL -10	Deletes one or a range of lines from a program. Use hyphens (-) to determine range.
	DOS	Calls the Disk Operating System menu. To return to Microsoft BASIC II, use the "B" option.
	KILL "D:PROG1.AMB"	Deletes a program from the named device. In the example, the file "PROG1.AMB" is deleted from the diskette in the disk drive.
	LIST LIST 10 LIST 10-100 LIST 10- LIST -10 LIST "P:" LIST "C:"	Lists one, a range, or all program lines to the TV screen. Hyphens (-) are used to set the range. Also lists program lines on the printer, cassette, or other specified device.
	LOAD "D:EXAMPLE1.AMB" LOAD "C:"	Loads a program into the computer's mem- ory. Program can be on diskette or cassette.
	LOCK "D:PROGRAM2.AMB"	Protects the program on diskette from accidental erasure.
	MERGE "D:EXAMPLE2.AMB" MERGE "C:"	Appends a program on diskette or cassette to one in memory. All duplicate line numbers coming from the device replace those in memory.

PROGRAM COMMANDS

Command	Examples	Brief Summary
	NAME "D:OLDFILE" TO "NEWFILE"	Renames a program on a device. In the example, the file named "OLDFILE" is renamed "NEWFILE"
	NEW	Erases a program from memory.
	RENUM RENUM 100,50,10	Renumbers program lines. If no parameters are used, the first line of the program is changed to 10, and the rest of the lines are incremented by 10. In the second example, program line 50 is changed to 100 and the rest of the lines are incremented by 10.
	RUN RUN 100	Begins execution of a program. In the second example, program execution begins at line 100.
	SAVE "D:TESTFILE.AMB"	Saves a program to a device in tokenized format.
	SAVE "D:TESTFILE.AMB" LOCK	Saves a program to diskette in tokenized format and locks it to prevent tampering. You cannot list or modify a locked file.
	TROFF	Turns off the trace mechanism.
	TRON	Turns on the trace mechanism.
	TROFF	Turns off the trace function.
	TRON	Turns on the trace function.
	UNLOCK "D:TESTFILE.AMB"	Unlocks a file on diskette so that you can write to, delete, or rename it.
	VERIFY "D:FILEPROG.AMB" VERIFY "C:"	Compares two programs – the one in mem- ory with one on diskette or cassette. If they do not match exactly, a TYPE MISMATCH ERROR occurs.

Statement	Examples	Brief Summary
	AFTER (3600) 125	Starts a time count using jiffies (1/60 of a second). In the example, after 3600 jiffies (1 minute), the program continues at line 125.
	CLEAR	Zeros all variables, nulls all strings, and clears all arrays.
	CLEAR STACK	Clears all time counts. May be used to abort the AFTER statement.
	CLOSE #1	Closes a previously opened file. The # sign is mandatory with the number to identify the input/output control block.
	COMMON ALL COMMON L, L1(2), L\$	Keeps program variables intact from one program to another. You may retain the contents of one, many, or all variables from program to program.
	DEF AVG(X,Y)=(X+Y)/2	Allows you to define your own functions. Both number and string functions may be defined. User-defined string functions are only available when the extension diskette is used.
	DIM A\$(35) DIM NUM(10,5,2)	Dimensions arrays. DIM tells the computer the number of elements expected in a string or numerical array. An array may be multi- dimensional.
	END	Terminates a program. It is the last statement used in a program. Closes all files and clears all time counts.
	ERROR 2	Forces an error in a program (as a debugging measure) to test how a program behaves when an error occurs. Forces both SYSTEM and BASIC errors.
	FOR X-0 TO 10	Sets up a counter for repeated execution of one or a group of statements. Executes all statements before the NEXT command, until the counter reaches the TO number. If STEP is used, the counter increments by the STEP amount.
	GET #1,X GET #1, AT(8,2)	GET and PUT are opposites. GET reads a single byte value and stores it in a variable.
	GOSUB 100	Causes a program to jump to another line and later return to the next statement. Used for calling a subroutine.
	GOTO 50	Causes a program to jump to another line to continue execution.

Statement	Examples	Brief Summary
	IF X=1 THEN Y=X	Tests strings and numbers for true and false conditions. If a condition is true, the program carries out the command following the THEN statement. If the condition is false, the program continues execution at the next line.
	IF X=0 THEN Y<>X ELSE Y=X	Is the same as IFTHEN except that a false condition means program execution passes to the command following the ELSE statement.
	INPUT I INPUT I\$ INPUT "Type a number";I INPUT "Your name?";I\$	Halts program execution to accept infor- mation from another device (default is keyboard). The INPUT statement accepts assignments to string and number variables. A "?" is used as a prompt unless the string option is used.
	INPUT AT (2,4) I\$	Is the same as INPUT except that the program accepts input at a specific location (column, row) on the TV screen.
	LET Z=2	Is optional for variable assignments. Z=2 is also acceptable.
	LINE INPUT "Name: "; I\$	Is the same as INPUT except that a full line (including spaces, commas, colons, and other delimiters) may be input from the keyboard or specified device. A "?" is used as a prompt unless the string option is used.
	LINE INPUT AT (4,4) I LINE INPUT AT (6,8) "Name: ";I\$	Is the same as LINE INPUT except program accepts input at a specific location (column, row) on the TV screen.
	MOVE 55,222,5	Moves memory from one location to another. In the example, five bytes of mem- ory starting at address 55 (decimal) are moved to the address beginning at 222. Hexadecimal numbers can also be used.
	NEXT NEXT I	Ends a FORTOSTEP statement block. The variable name is optional. (See FOR TOSTEP/NEXT.)
	NOTE #4, I,J	Locates the next byte to be read from a diskette file. In the example, NOTE stores the position of the current sector number in I and the current byte in J.

Statement	Examples	Brief Summary
	ON ERROR 550	Forces execution of a program to a speci- fied line when encountering an error. In the example, the program will continue at line 550 if an error occurs. RESUME is required to return execution to the original routine.
	ON G GOSUB 100,200,300	Determines which subroutine to execute next. In the example, the variable G should be 1, 2, or 3, causing the program to jump to line 100, 200, or 300. (See RETURN.)
	ON G GOTO 100,200,300	Determines which of a group of lines will be executed next. In the example, G should be 1, 2, or 3, causing program execution to jump to line 100, 200, or 300.
	OPEN #3,"P:" OUTPUT OPEN #4,"D:PROGSAV.AMB" INPUT	Opens a file for reading or writing. The statement identifies the input/output control block used by a specified device, such as a printer or disk drive, and declares the type of operation to be carried out (UPDATE, APPEND, INPUT, or OUTPUT).
	OPTION BASE 1	Declares the base number of all arrays and variables. Allows the user to set the base number used in loops and arrays. The default is zero (0). In the example, all pro- gram arrays will automatically begin at 1.
	OPTION CHR1 OPTION CHR2 OPTION CHR0	Reserves bytes of memory for RAM char- acter data. OPTION CHR1 sets aside 1024 bytes, OPTION CHR2 sets aside 512 bytes, and OPTION CHR0 releases all OPTION CHR reservations. (See VARPTR.)
	OPTION PLM1 OPTION PLM2 OPTION PLM0	Reserves bytes of memory for player- missile graphics. OPTION PLM1 reserves 1024 bytes, OPTION PLM2 reserves 512 bytes, and OPTION PLM0 releases all OPTION PLM reservations. (See VARPTR.)
	OPTION RESERVE 24	Reserves bytes of memory for machine language routines. (See VARPTR.)
	PRINT"Hello" PRINT 25 * 4 PRINT "Reply — ";R\$?Y	Prints number and string constants and variables on the TV screen. By itself, PRINT causes a blank line to be printed on the TV screen. The question mark symbol (?) can also be used in place of the full word PRINT.
	PRINT AT(4,4)RX\$	Prints number or string constants and vari- ables at a specific location (column, row) on the TV screen, or a specific sector and byte of a diskette file.

Statement	Examples	Brief Summary
	PRINT SPC(5)"Hi!";SPC(5)"Bye"	Prints the number of spaces specified in the parentheses, counting from the current cursor position. Differs from TAB, which always counts spaces from the leftmost column.
	PRINT TAB(5)"Hello"	Prints the number of spaces specified in the parentheses, starting at the leftmost column of the text field.
	PRINT USING "#";1 PRINT USING "##";NUMBER PRINT USING "###,##";MONEY PRINT USING "###,###,AMT# PRING USING "*** ###.##";CASH PRINT USING "\$###.##";DOLLAR PRINT USING "\$\$###.##";CHECK PRINT USING "**\$###.##";FLOAT PRINT USING "##~~~~";EXPONENT PRINT USING "+###";PLUS PRINT USING "##+";MINUS PRINT USING "!;INITIAL\$ PRINT USING "% %";PART\$	Lets you format your text 12 ways, including: — Aligns numbers in columns signified by pound sign — Places a decimal point in the result — Offsets every three digits (thousands) with a comma — Pads empty digit spaces with asterisks — Prints a dollar sign (\$) before left digit — Prints a floating dollar sign (\$) in result — Combines floating "\$" with filler "*" in result — Prints result in exponential (E or D) format — Prints a plus sign (+) before or after result — Pulls out the first character in a string — Pulls out part of a string
	PUT #6, ASC("A");	PUT and GET are opposites. PUT writes a single byte value (0-255) to a specified file or device.
	RANDOMIZE RANDOMIZE 20	Seeds the RND function to assure that a different sequence of random numbers occurs each time a program is run. The second example assures that a random sequence is generated repeatedly.
	READ A,B,C DATA 1,2,3	Assigns numbers or strings in the DATA statement to variable names in the READ statement.
	REM Ignore this comment ! Ignore this remark ' Ignore this remark, also X=1:REM Colon is necessary X=1 ' No colon is necessary	Allows explanations in your program. REM (short for "remark") statements are ignored during program execution. You can use an exclamation mark (!) or an apostrophe (') in place of the word REM.

Statement	Examples	Brief Summary
	RESTORE RESTORE 110	Allows the reuse of DATA statements. If no parameter is used, READ re-reads data from the first DATA statement. In the second example, RESTORE causes the READ state- ment to begin reading data at line 110.
	RESUME RESUME 55 RESUME NEXT	Helps program recover from an error or a time count. RESUME sends program execu- tion back to the line in which an error or time interrupt occurred. If a line number is used, the program resumes at that line. If a NEXT statement is used, program execution resumes with the statement following the error or interrupt (may be on the same line). RESUME completes the ON ERROR and AFTER statements.
	RETURN	Completes the GOSUB and ONGOSUB statements and returns a program from a subroutine. (See GOSUB.)
	PRINT STACK IF STACK=0 THEN PRINT "Stack full"	Gives the number of entries available on the time stack (used to hold jiffies for AFTER and SOUND).
	STOP	Halts execution of the program. Use CONT to continue program execution (starting with the next line).
	WAIT &D40B,AND &FF,110	Halts program to wait for certain conditions to occur. Advanced animation techniques use WAIT to handle VBLANK. In the example, the program looks at the contents of address &D40B, ANDs it with &FF, and waits until it equals 110.

PROGRAM FUNCTIONS

Numeric Functions	Examples	Brief Summary
	Y=ABS(-7)	Computes the absolute value of a number.
	X=ATN(5.3)	Computes the arctangent of a number.
	PRINT COS(.95)	Computes the trigonometric cosine of a number.
	EULER-EXP(3)	Computes the Euler's number (e) raised to the power of the number in parentheses.
	PRINT INT(5.3)	Returns the integer of a number, always rounding down to the next lower number.
	L=LOG(.5)	Computes the natural logarithm of a positive, nonzero number.
	R—RND PRINT RND(0) NUMBER—RND(100)	Generates random single-precision num- bers. RND by itself or with a zero in paren- theses produces a random value between 0 and 1. Used with a nonzero number in parentheses, it produces an integer between 1 and the number. In the example, RND (100) returns a random number between 1 and 100.
	PRINT SGN(R*B)	Returns the sign of a number. If the number is positive, the value returned is $+1$. If the number is zero, the value returned is 0. If the number is negative, the value returned is -1 .
	PRINT SIN(1)	Computes the trigonometric sine of a number.
	ROOT=SQR(25)	Returns the square root of a positive number.
	PRINT TAN(.22)	Computes the trigonometric tangent of a number.
	PRINT INITIAL\$ + NAME\$	Joins two strings together.
	PRINT ASC("Sam")	Returns the ATASCII code in decimal for the first character contained in parentheses. In the example, the first character is "S," which is 83 (decimal) in ATASCII code.
	A\$=CHR\$(65)	Converts the ATASCII code in parentheses to a one-character string. CHR\$ is the oppo- site of the ASC function.
	R\$=INKEY\$	Returns the last key pressed.

PROGRAM FUNCTIONS

String Functions	Examples	Brief Summary
	HOLD=INSTR(5,A\$,"THE")	Searches for a small string inside a large string. Returns the character position within the larger string where the smaller string begins. If not found, it returns a zero (0). In the example, the search begins at the fifth character in A\$, looking for "THE." If no starting number is given, the search begins at the first character in the larger string.
	PRINT LEFT\$("LEFTY",4)	Returns characters from the left side of a string. In the example, "LEFT" will be printed.
	PRINT LEN(C\$)	Returns the length (number of characters) of a string.
	PRINT MID\$("THEMIDPART",4,3)	Returns characters from the middle part of a string. In the example, the selection of three characters in A\$, starting with the fourth character, result in printing "MID."
	A\$=RIGHT\$("THERIGHT",5)	Returns characters from the right side of a string. In the example, the A\$ is assigned "RIGHT."
	C\$=SCRN\$(5,5) PRINT ASC(C\$)	Returns the value of the character in text modes; in graphics modes, it returns the color register number in ATASCII code (except in graphics modes 4 and 6).
STR\$	X = STR\$(99.99)	Converts a number into a string. It is the opposite of VAL.
	PRINT STRING\$(36,"*") PRINT STRING\$(36,42)	Returns a string of characters. In the first example, 36 repetitions of a string (the asterisk) are printed. In the second example, 36 repetitions of the CHR\$ function are printed (42 is the value of the asterisk in ATASCII code). In other words, both result in a string of 36 asterisks.
	PRINT TIME\$	Returns the contents of the TIME\$ string, which consists of hours, minutes, and seconds (12:01:00).
	PRINT VAL(R\$)	Converts a string to a number. It is the opposite of STR\$.
	EOF (4)	Returns a value of true or false to indicate the end-of-file condition of the last read from an input/output control block.

PROGRAM FUNCTIONS

Special Purpose	Examples	Brief Summary
	PRINT ERL	Returns the line number of the last encoun- tered error.
	PRINT ERR	Returns the code number of the last encountered error.
	PRINT FRE(0)	Returns the number fo free RAM bytes avail- able for use.
	PRINT PEEK(751) ADRS = PEEK(PLACE)	Returns the contents of the memory address enclosed in parentheses. The address and byte can be a number or variable, in decimal and hexadecimal. You may look at ROM as well as RAM addresses.
	POKE 1034,255 POKE ADRS,J POKE PLACE,X *Y/2	Inserts a byte into an address location in RAM (but not in ROM). The address and byte can be a number, arithmetic expression, or a variable—in decimal or hexadecimal.
	PRINT STATUS (4)	Holds the value of the fourth byte of the input/output control block; the value tells the error condition (1—error; 0—no error).
	PRINT TIME	Returns the real time clock (RTCLOK) loca- tion's contents. Unlike TIME\$ (which returns the elapsed time in hours, minutes, and seconds), TIME gives its value in jiffies (1/60 of a second).
	X—USR(898,0)	Passes control of the program to a machine language subroutine. In the example, the USR function passes control to a sub- routine at 898 decimal. An optional number may be passed along with the address, for use in the subroutine.
	ADRS—VARPTR(A\$) PRINT VARPTR(A\$)+1 PLAYR1—VARPTR(PLM1) PRINT VARPTR(CHR1) PRINT VARPTR(RESERVE)	Returns the memory address of a variable's symbol table entry. In the first example, VARPTR returns the number of bytes in the string. In the second example, the starting address of the string is printed. In the other examples, VARPTR returns the address (MSB,LSB) of the first byte allocated for player-missile graphics, a character set, and the reserved memory set aside for assembly language programs.

FUN FEATURES

Graphics	Examples	Brief Summary
	CLS CLS 25	Clears the screen text areas and sets the background color register to the indicated color value. In full screen modes, the optional number after CLS sets the border color and luminance. In split screen it deter- mines the background color and luminance.
	COLOR 4	Specifies the color register to be used for color graphics.
	FILL 5,5 TO 5,20	Fills an area of the TV screen with the color of the specified color register number.
	GRAPHICS 0 GRAPHICS 2+16 GRAPHICS 7+32	Selects one of 12 graphics modes (CTIA provides 8 graphics modes). Adding +16 to any graphics mode provides a full screen display. Adding +32 prevents the graphics command from clearing the screen.
	PLOT X,Y PLOT 5,5 TO 10,5	Draws a point, a line, or several continuous lines on the TV screen.
	SETCOLOR 5,4,10	Associates a color and luminance with a color register. The first parameter names the register used (0-3 is for player-missiles, 4-7 is for playfield colors, and 8 is always the background register). The second parameter is the color hue number (0-15), while the third parameter is the luminance (an even number between 0 and 14 – the higher the number, the brighter the luminance).
	PADDLE(0) = 624 PADDLE(1) = 625 PADDLE(2) = 626 PADDLE(3) = 627 PADDLE(4) = 628 PADDLE(5) = 629 PADDLE(5) = 630 PADDLE(7) = 631	Paddle controller statuses are stored in locations 624 to 632. There are four paddle controller ports, each port handling two paddle controllers. The leftmost paddle con- troller's status is stored in location 624, and so on. The status ranges from 1 to 228 as the paddle is turned counterclockwise.

FUN FEATURES

Game Controllers	Number	PEEK Location	Brief Summary
	PTRIG(0) PTRIG(1) PTRIG(2) PTRIG(3) PTRIG(4) PTRIG(5) PTRIG(6) PTRIG(7)	- 636 - 637 - 638 - 639 - 640 - 641 - 642 - 643	Paddle trigger statuses are in locations 636 to 643. The trigger of the leftmost paddle is stored in location 636, and so on. If the trigger has been pressed, a zero (0) is found at its address by PEEK(PTRIG(n)). If the trigger has not been pressed, it contains a one (1).
	STICK(0) STICK(1) STICK(2) STICK(3)	= 632 = 633 = 634 = 635	The joystick controller statuses are stored in locations 632-635. The leftmost joystick status is stored in location 632, and so on. The status contains a value as shown in the figure below.
	STRIG(0) STRIG(1) STRIG(2) STRIG(3)	= 644 = 645 = 646 = 647	The joystick trigger statuses are stored in locations 644 to 647. The trigger status of the leftmost joystick is stored in location 644, and so on. The status byte contains a zero (0) if the trigger has been pressed, and a one (1) if not.
	OPTION SELECT START No Key	→ PEEK(53279)=3 → PEEK(53279)=5 → PEEK(53279)=6 → PEEK(53279)=7	The status of the OPTION,SELECT, and START keys is stored in location 53279. The status contains a 7 until one of the three keys is pressed. It then has a value of 3, 5, or 6, depending on which key is pressed.

ERROR CODES

Error Code # Explanation

For a full explanation of the following errors, see Appendix O of the ATARI Microsoft BASIC II Reference Manual:

Error Code #	Explanation		
	NEXT without FOR	135	IOCB read-only error
	Syntax error	136	EOF
	RETURN without GOSUB	137	Truncated record
	Out of data	138	Device timeout
	Function call error	139	Device NAK
	Overflow	140	Serial bus
	Out of memory	141	Cursor out of range
	Undefined line	142	Serial bus data frame
	Subscript out of range		overrun error
	Redimension error	143	Serial bus data frame
	Division by zero		checksum error
	Illegal direct	144	Device-done error
	Type mismatch File I/O error	145	Read after write-compare
		140	error
	Quantity too big Formula too complex	146	Function not implemented
	Can't continue	147	Insufficient RAM
	Undefined user function	160 161	Drive number error
	No RESUME	162	Too many OPEN files
	RESUME without error	163	Disk full
	FOR without NEXT	105	Unrecoverable system data I/O error
	LOCK error	164	File number mismatch
	Time error	165	File name error
	BREAK abort	166	POINT data length error
	IOCB error	167	File locked
	Nonexisent device	168	Command invalid
	IOCB write-only error	169	Directory full
	Invalid command	170	File not found
	Device or file not open Bad IOCB number	171	POINT invalid
